8, HASTINGS STREET.

PREFACE TO VOL. III.

SUBSEQUENT to the appearance of the first volume of this work, the Editor was engaged, for nearly two years, in connection with the Colonial and Indian Exhibition. On his return to India in April 1887, he resumed the Dictionary work, and the second volume was published in little more than a year from that date. During the course of preparation of that volume, however, the Government of India considered it desirable to modify materially the scope and character of the work, enlarging it in some directions and abbreviating it in others. It was, for example, deemed unnecessary to give botanical descriptions of the plants dealt with, and thought advisable to practically omit all imported articles of Indian trade, to discontinue reference to Ceylon products, when not directly connected with India, and also to reduce the number of tables given in statistical accounts of trade. A minor departure was, at the same time, enjoined in the adoption of the third person, in preference to the first, but that would in any case, have been necessitated, for, shortly after the second volume had been completed, the Government of India was enabled to render in valuable aid by the deputation as collaborateurs of Mr J F Duthie, Director of the Botanical Department, Northern India, and shortly afterwards of Dr. J Murray, of the Indian Medical Service. The Editor has now to express his warmest thanks to these gentlemen for the able assistance they have rendered. He need only add that the respective share taken by each contributor is indicated by the appearance of his name on the right hand top corner of the pages.

During the preparation of the third volume the Editor's task was indeed a pleasant one, for, the entire material of the Dictionary having been brought together and arranged by him some years ago, his editorial work consisted in seeing that the elaboration of the portions entrusted to his collaborateurs was on the plan laid down by the Government of India.

It may perhaps be admitted that the third (and perhaps also the second) volume manifests a considerable improvement on the first. This was to be expected, since the co operation of Mr. Duthie and Dr. Murray ensured greater accuracy, through doubtful points having invariably been decided in consultation. A numerous circle of correspondents have also been consulted, amongst whom may be specially mentioned Dr George King Superintendent of the Royal Botanic Gardens and Dr D Prain, Curator of

the Herbarium, Calcutta; Mr. H. Medlicott (and his successor Dr. W. King), Superintendent of the Geological Survey; and the authorities of the Imperial Museum. The Directors of Land Records and Agriculture in the various provinces, by official requisitions through the Revenue and Agricultural Department of the Government of India, have given the Editor much useful information on various subjects. On trade questions invaluable assistance has been rendered by Mr. J. E. O'Connor, Assistant Secretary to the Government of India, Finance and Commerce Department, by the Chambers of Commerce, and by many mercantile experts and planters throughout the country, to all of whom the Dictionary is indebted for many of its most useful features. The official correspondence of the Government of India has also continued to be placed under free contribution, and the various branches of the Secretariat have uniformly and graciously responded to applications for assistance by placing their files on Economic Products at the disposal of the Editor.

GEORGE WATT,

*Editor, Dictionary of the Economic
Products of India.*

SIMLA,

Indigo-producing plants.

FODDER.

description: "the finest developed native specimens are generally found in waste places, by the sides of hedges and dykes, on way-side banks, and in shady copses. It surpasses most of the native grasses in the enduring rapidity of its growth after being eaten or cut down, as well as in the quantity and quality of its produce; and as it is readily devoured by cattle, sheep, and horses, it became, at an early period in the history of grass culture, an object of agricultural care, having been grown in England in 1764, and that, at first, from seed received under its American name of *Orchard grass*, from Virginia, where considerable progress had been made in its cultivation." Royle alludes to it as common on the North-West Provinces and the Panjáb Himálayas, and in Atkinson's *Himálayan Districts* it is said to occur at Naini Tál, Kathi, Jalat, and Jhuni on open situations, at an altitude of 6,000 to 8,000 feet. By several writers it is spoken of as "frequent on the Himálayas," but no effort appears to have been made to cultivate the plant for fodder purposes. In the *Gazetteer* of Mysore and Coorg it is said to be cultivated in the Bangalore Gardens, but practical experiments have still to be performed to ascertain the Indian regions where its cultivation is possible. Roxburgh alludes to two plants—*D. lagopoides*, Linn., and *D. brevifolia*, Linn.—as found on salt, sandy soil near the sea. The former is referred to by Dalzell and Gibson (*Bombay Flora*, p. 298) as common near the sea, and is said to be the *Poa brevifolia*, Kunth. Roxburgh placed these plants in *Dactylis*, because of Burman having done so, but was of opinion that they were more probably forms of *Poa*. At all events they are not species of *Dactylis*.

Dactyloctenium ægyptiacum, Willd.; GRAMINEÆ, see *Eleusine ægyptiaca*, Pers.

D. scindicum, Boiss. see *Eleusine scindica*.

DÆDALACANTHUS, *T. Anders.*; *Gen. Pl.*, II., 1082.

A genus of shrubs containing several highly ornamental plants, some of which are extensively cultivated in Indian gardens. They are known to afford indigo, a property possessed by many members of the family to which they belong. It is probable also that they are all, like *D. roseus*, used medicinally. The following may be specially enumerated.

[ACANTHACEÆ.

4 **Dædalacanthus nervosus**, *T. Anders.*; *Fl. Br. Ind.*, IV., 418;

Syn.—*JUSTICIA NERVOSA*, Vahl., *Bot. Mag.*, t. 1358; *ERANTHEMUM NERVOSUM*, Br. Prod., 477.

Vern.—*Shechin*, NEPAL; *Topatnyok*, LEPCHA; *Nalla nilámbari*, *vádám-bram*, TEL.

References.—Gamble, *Man. Timb.*, 280; *Cat. Darj.*, 59; Walter Elliot, *Flora Andhr.*, 126, 187; *Bomb. Gaz.*, XV., 440; *N.-W. P. Gaz.*, IV., p. lxxvi.

Habitat.—A frequent plant at the base of the Himálayas (1,000 to 3,000 feet) from the Panjáb to Bhután. Cultivated in most tropical countries; flowers bright blue.

Properties of this and the other species have been described for the sake of economy under the genus.

5 **D. purpurascens**, *T. Anders.*; *Fl. Br. Ind.*, IV., 420.

Syn.—*ERANTHEMUM NERVOSUM*, in *Dalz. & Gibs.*, *Bomb. Fl.*, p. 195; *E. PULCHELLUM*, Roxb., *Fl. Ind.*, Ed. C.B.C., 37.

Vern.—*Kalla-jati*, BENG.; *Gul-sham*, HIND.

Habitat.—A fairly abundant plant in the forests of the central table-land of India, at altitudes of 1,000 to 4,000 feet in Central India, Bombay

DAHI.

Curd or Coagulated Milk.

FIBRE.

a promising substitute for flax. In a recent report furnished by the Conservator of Forests, Northern Circle, Madras, it is stated that "the plant is common in the drier districts of the Presidency. It affords a very pretty fibre which is said to be sometimes used for fishing lines."

The fibre was not shown at the Colonial and Indian Exhibition, but as the plant is extremely plentiful, there should be no difficulty in procuring a large annual supply.

MEDICINE

- Plant.
- II
- Leaves.
- 12
- Juice.
- 13

Medicine.—The PLANT has emetic and expectorant virtues, and is extensively employed by natives in the diseases of children. Ainslie says that "a decoction of the LEAVES is given to children as an anthelmintic, in doses not exceeding three table-spoonfuls; the JUICE of the leaves is ordered in asthma." The *Pharmacopœia* assigns the above properties to it, as current native opinion, but adds that, although reputed to be a cure for snake-bite, this rests on insufficient grounds. Dr. Oswald held that it was a fairly good expectorant in the treatment of catarrhal affections, in ten-grain doses, for which purpose it was used at the Pettah Hospital, Mysore. Dr. Dymock says that in "Western India the plant has a general reputation as an expectorant and emetic. In Goa the juice of the leaves is applied to rheumatic swellings." Drury adds the further fact that "the juice of the leaves mixed with *chunam* is applied externally in rheumatic swellings of the limbs."

SPECIAL OPINIONS.—§ "Used in infantile diarrhœa." (*Surgeon-Major D. R. Thomson, M.D., C.I.E., 1st District, Madras*). "The fresh leaves made into a pulp are used as a stimulating poultice in carbuncle, with good effect" (*Asst Surgeon Sakharām Arjun Ravat, L.M., Bombay*). "Certainly valuable as an emetic with infants: the leaves are washed, and the juice expressed by rubbing between the palms of the hands; the leaves of the dark *Toolsi* are similarly treated, and then a mixture of the juices is given; this preparation is a stimulating emetic" (*Civil Surgeon B Evers, M D., Wardha*).

FODDER.

- Plant.
- 14
- 15

Fodder.—The PLANT is said to be browsed by goats.

Dæmonorhops (Calamus) Draco.—The Dragon's Blood Palm; see Vol. II., C. No. 68.

Dahi (DADHI, Sans.)

A term given to a kind of curd or rather coagulated milk. To prepare this the milk is first boiled, then soured by being thrown into an unwashed vessel in which *dahī* had been previously kept. At times, however, an acid is employed to precipitate the solid ingredients of the milk, and rennet is used by a certain limited community only. *Dahī* thus differs from curd as prepared in Europe in being practically sour boiled milk. The milk is boiled almost immediately after being obtained from the cow, and thus contains all its fat or butter. *Dahī* in the liquid state is largely consumed, so that the whey not being separated *Dahī* contains in solution all the sugar of milk. The curd or casein, even if separated from the whey, contains, however, too much fat to be made into cheese. It is, in fact, cream cheese, and on drying crumbles to a powder. The whey is separated by pressing the curd inside a cloth, and in this condition it is largely used in cookery, and is the basis of all the sweetmeats made in India. The natives of India have thus come to learn that to eat the liquid *dahī* they are consuming a wholesome mixture of the muscle-forming materials casein and fat with the heat-giving ingredient—sugar—the equivalent of starch. But to eat the curd alone to any large extent would be injurious by causing severe constipation. After being made into sweetmeats it is, however, rendered highly nutritious through having restored to it sugar,

and by being mixed with flour of wheat or of rice is made into an article of diet. Hence it follows that the sweetmeats so largely consumed as a midday meal in India partake of all the ingredients of food and are not mere luxuries like the sweets of Europe.

The trade in expressed *dahi* is very extensive, and within a radius around the larger cities immense quantities are carried by train—the plastic substance being contained within a cloth and resting in open baskets. The manufacture of cheese is practically unknown in India.

DAHL.

References.—*Kurz, For. Fl. Burm., I., 342; Gamble, Man. Timb., 128; Indian Forester, I., 120; VI., 125; VIII., 416; Balfour, Cyclop., I., 878.*

Habitat.—A moderate-sized tree of Burma (Prome), in general habit resembling *D. lanceolaria*, especially in the character of the pod. *Kurz* says it is common in all leaf-shedding forests, especially in the upper mixed savannahs and *Eng* forests, all over Burma from Ava to Martaban, and down to upper Tenasserim.

Resin.—Exudes a red resin according to *Kurz*. Mr. M. H. Ferrars says that the Karenis use the plant for the propagation of lac.

Oil.—*Balfour* states that this tree furnishes a useful oil.

Structure of the Wood.—Purplish-black, with darker streaks, harder than, but in structure similar to, that of *D. latifolia*. Weight 83lb a cubic foot. The sapwood is pale-coloured, turning pale brown, very perishable; the heartwood blackish and ebony-like, often streaked red on a paler ground, extremely durable.

It is employed for wheels, agricultural implements, handles of *dahs* and spears, but especially for carving.

sometimes called Indian rose-wood from the resemblance when polished to the timber of that name. The planks of black-wood have one great defect—a tendency to split longitudinally when not well seasoned. Beddome remarks of the wood: "it differs much in colour, but is generally purple-black; it admits of a very fine polish, and is our best furniture wood, and is extensively used for gun-carriage purposes." "It generally fetches a higher price than teak." Roxburgh says Bengal-grown timber is "not so heavy as that obtained on the coast of Coromandel and Malabar, though fully as beautiful." Wight states that the Madras plant more closely corresponds with Roxburgh's *D. emarginata* than *D. latifolia*, "but the wood of the former is not black, which I think fatal to their identity. It is possible, however, that the Malabar tree may be specifically distinct from the Bengal one." Wight also states that planks, often 4 feet in diameter, are obtained from Malabar, and that too after all the white external wood has been removed. Roxburgh alludes to a tree 20 feet in circumference.

Dalbergia Mooniana, *Thwaites*; see *Pericopsis Mooniana*, *Thwaites*;
Fl. Br. Ind., II., 252.

48

D. (Drepanocarpus, Kurz) monosperma, *Dalz.*; *Fl. Br. Ind.*,
[II., 237.

Syn.—*D. PANICULATA*, *Wall.*; *D. TORTA*, *Grah.*

Habitat.—Shores of the Western Peninsula, Ceylon, and the Malayan Peninsula (*Fl. Br. Ind.*). Tidal jungles of Upper Tenasserim (*Kurz*). A scandent bush with hooked branches (Conf. with *Gamble, Man. Timb.*, 124; *Dalz. & Gibs., Bomb. Fl.*, 78).

49

D. nigrescens, *Kurz, For. Fl. I.*, 346.

Vern.—*Thitsanweng* or *thitsawnwin*, BURM.

References.—*Kurz, For. Fl. Burm.*, 346; *Gamble, Man. Timb.*, 129.

Habitat.—A moderate-sized deciduous tree, of the dry mixed forests of Upper Burma. Leaves small, blunt or retuse, panicles dense or compact, pedicles short. The name is given on account of the leaves turning black on being dried.

TIMBER.

50

Structure of the Wood.—Light-grey, soft; weight 38lb a cubic foot.

There is some doubt about the identification of these species owing to the absence of concentric bands (*Gamble*). It is not referred to in the *Flora of British India*.

rubiginosa.A *Dalbergia* said to be good for burning lime-stone.**TIMBER.**

of the wood : in one specimen the shoots are from close to the centre of the stem. The stumps were 12 inches in radius, and the concentric rings vary from half an inch to a whole inch in thickness. In the case of shoots springing from near the centre of the stem, the latter appears to have been decomposed at the centre, and the shoot, which may have originated in a layer of soft tissue, has passed radially across three zones of harder and two of softer tissue. This discovery of Mr. Moss' appears to be a new one in vegetable physiology, as adventitious shoots generally spring from the cambium zone, or directly between the wood and bark."

DOMESTIC.

56

Domestic Uses.—Leaves and twigs are used to manure fields in Madras (*Ind. For.*, IX., 357).

57

Dalbergia purpurea, Wall. ; *Fl. Br. Ind.*, II., 235.

of its localities, however, being the result of the effort to extend its cultivation It is probable that its indigenous habitat is very much narrower than we are accustomed to think Neither Kurz nor Mason make any

DALBERGIA
Sissoo.

The Sissoo Tree.

mention of its occurrence in Burma. Roxburgh regards it as a native of Bengal "and of the adjoining provinces to the northwards." Brandis views it as a native of the sub-Himalayan tract, and adds "generally gregarious, mostly on sand or gravel along the banks of rivers or on islands extending 50 to 100 miles into the plains. Believed to be indigenous also in Guzerat, Baluchistan, and Central India. I have never seen it really wild outside the sub-Himalayan belt. Cultivated and often self-sown throughout India: thrives best on light soil, and requires a considerable amount of moisture. The old leaves turn reddish brown and begin to fall in December, but continue to be shed up to February, when the young foliage comes out, continuing till April." "Flowers from March to June, at times with a second flush between July and October; the seed ripens from November to February, and generally remains long on the tree." Beddome says it only occurs as an avenue tree in the Madras Presidency.

Mr. J. H. Lace, Assistant Conservator of Forests, Quetta, who has given much careful study to the plants of Baluchistan, says: *D. Sissoo* is "indigenous about the Harnai, the Mehrab-Tangi, and up to Sharigh (4,000 feet). The Wam Tangi Forests near the Harnai is chiefly composed of it, where it grows up to 35 feet in height." Mr. Mann, Conservator of Forests, Assam, says: "It occurs naturally only in the Eastern Duars of the Goalpara District in Assam. With the exception of a few scattered trees in the Lakhimpur District up stream from Dibrugarh, no Sissu is found in the Cachar or Sylhet Districts." The Assistant Conservator of Forests, Ajmere-Merwara, writes that while *D. latifolia* and *D. lanceolaria* are wild, *D. Sissoo* is cultivated. The Conservator of Forests says, it is cultivated in Sind, and that plantations, 20 years old, exist. It requires a good soil and care during its first year or two. Stewart regards it as indigenous in the Kachhi Forest, Panjáb, on the islands of the Indus opposite Bannu. The Conservator of Forests, Northern Circle, Madras (in a report forwarded through the Board of Revenue) says that "Sissu is only found in cultivation in the Madras Presidency. It does well on river banks as in the plantations on the Cauvery in Trichinopoly and fairly well on coast stands as at Musulipatam."

Oil.—The wood is said to yield an empyreumatic, medicinal OIL. In a recent report from the Forest Department, North-Western Provinces, it is stated that oil is expressed from the SEEDS.

Medicine.—The RASPIINGS of the wood are officinal, being regarded as alterative (*Beddome*). "It is considered by natives to be hot (*Stewart*). Useful in leprosy, boils, eruptions, and to allay vomiting; also in special diseases" (*Baden Powell*). The ROOTS are said to be so astringent that they are neither eaten by rats nor ants. "The LEAVES and sawdust (raspings) in decoction are esteemed in eruptive and special diseases, and to allay vomiting. The OIL is also applied externally in cutaneous affections" (*Atkinson, Himalayan Districts*).

SPECIAL OPINIONS.—§ "The MUCILAGE of the leaves mixed with sweet oil is a good application in cases of excoriation. A DECOCTION of the leaves is given in the acute stage of gonorrhœa" (*Civil Surgeon F. Anderson, M.B., Bijner*). "The BARK made into pills with aromatics such as ginger, &c, checks cholera" (*V. Ummagallien, Mettappellium, Madras*).

Fodder.—The young trees are liable to be browsed by cattle, goats, and camels (*Stewart*); but the arrangements for forest conservation prevent this as much as practicable.

Structure of the Wood.—Sapwood small, white; heartwood brown with darker longitudinal veins, close and even-grained, seasons well, very hard. Annual rings not distinctly marked, alternating dark and light-coloured bands, which run into each other.

Sissoo Wood

(G Watt)

DALBERGIA spinosa

The wood is very durable, seasons well, and does not warp or slip. It is highly esteemed for all purposes where strength and elasticity are required. Clifford says that "in strength it is only inferior to *sal*, while in many other useful qualities it surpasses it, and has the advantage of being lighter. For FELLOES and NAVES of wheels and carved work of every description, for framings of carriages and similar work, it is unsurpassed by any other wood, owing to its fine seasoning and standing

TIMBER

79

RIAGRS than it can be at present, owing to the comparatively small supply. With regard to its durability and strength as a wood for wheels, Clifford writes "The WHFFLS of our ordnance carriages have never failed,

have
than
world
went
ain to

India without a break-down while Royal Artillery wheels, built of the very best materials Woolwich could produce, specially for Indian service, almost fell to pieces after a few months' exposure and service on the plains of India."

It has been tried and found to be good for SLEEPERS and Mr McMaster, in the *Proceedings of the Institution of Civil Engineers*, Vol. XXIII, 1863, says it will be really good for that purpose. The wood makes excellent CHARCOAL. Stewart recommended the cultivation of the tree for the purpose of railway FUEL, and Mr Baden Powell, while Conservator of Forests in the Panjab, planted out large tracts of country for this purpose. It is much planted as an AVENUE tree all over India, and in forest plantations in the Panjáb and Bengal. At the Colonial and Indian Exhibition Conference on timbers, Sir D Brandis is reported to have said, "The tree is chiefly found along the streams which emerge from the Himálaya. Large trees became scarce about 60 years ago, but the tree is now regularly and extensively planted. An exhaustive report was prepared in 1826 by an eminent botanist, Dr Wallich, respecting the localities producing the *Sissu*, which showed that the supply of large timber was at that time nearly exhausted. *Sissu* can, however, be easily cultivated in India, and on a large scale, in fact almost as easily as Spruce in Europe. Very extensive plantations have already been formed, and they could be extended over a great area if a sufficient demand arose for the timber. The tree has, for example, been

DAMMARA
orientalis.

The Pines.

DAMMARA, *Lamb.*; *Gen. Pl.*, III., 436; *Fl. Br. Ind.*, V., 650.

Lambert (*Genus Pinus*, smaller edition) accepted Salisbury's position in separating the species of Dammar from the genus PINUS; he, however, preferred the name *Dammara*, *Rumph.*, to *Agathis*, *Salisb.*, the result being that *Dammara* has become better known. In a work like the present, which is more or less of a commercial character, it has been thought desirable to preserve the older name *Dammara*, and as *Agathis* has not been dealt with in the first volume of this work, it becomes all the more necessary to give the economic information in the present place. The *Flora of British India* adopts *Agathis* in preference to *Dammara*.

109

Dammara australis, *Lamb.*; *Genus Pinus*, t. 54.

THE KAURI PINE.

Syn.—AGATHIS AUSTRALIS, *Salisb.*

References.—*Gordon, Pinetum*, 108; *Gamble, Man. Timb.*, 394; *Indian Forester*, III., 177, 184; V., 104; VII., 363; XII., 476, 553; *Mysore and Coorg Gaz.*, I., 66; *Smith, Dict. Econ. Pl.*, 149; *Royle, Productive Resources*, 68; *Mueller, Extra-Tropical Pl.*, 102; *Beddome, Fl. Sylv.*, 227; *Trans. Agri-Hort. Soc.*, V., 110; VI., 103—105.

Habitat.—A native of New Zealand, now confined to the North Island, but formerly more extensively distributed. Cultivated in most tropical and sub-tropical countries. The tree is being experimentally cultivated in India, but apparently not with the vigour which the importance of the subject deserves. *Royle* alludes to a consignment of 353lb of seed of Dammar having been consigned to India in 1796, and in *Mysore* the descendants (presumably) of this stock may still be seen. *Beddome* alludes to *Dammara* as represented on the mountains of Madras.

RESIN.
IIIO

Resin.—In the above remarks regarding Dammar resin some of the main features of the trade have been indicated. In *Lambert's* work, quoted above, is reproduced *Rumphius'* interesting article on the subject, one of the most important which has as yet appeared. Some idea of the value of the resin may be obtained from the fact that the imports into Great Britain are stated to have been worth £200,000. The tree is rapidly being exterminated in New Zealand, as its timber is of great value, and it is problematic how long the supply of fossil resin will continue to meet the growing demand. The tree attains a height of 120 to 150 feet, with a circumference of 24 feet.

THE AMBOYNA PINE.

Syn.—D. ALBA, *Rumph.*; AGATHIS LORANTHIFOLIA, *Salisb.*; *Fl. Br. Ind.*, V., 650.

Vern.—Theet-men (according to Mason), BURM.

Habitat.—A large tree, native of Amboyna, and Ternate, of the islands of Molucca, Java, Borneo, &c. *Mason*, in his list of the plants of Burma, enumerates this species, but *Kurz* makes no mention of it. *Wallich* states that it is found in Tavoy, and the *Flora of British India* that it is a native of Penang and Perak.

RESIN.
II12

Resin.—The timber is of little value, but the tree affords large quantities of a transparent resin known as Dammar. This is conveyed to most parts of the world, being used in India as incense and for medicinal purposes. In Europe it is largely used like the resin of the above species for purposes of varnishing and for waxing or polishing fabrics. (*O'Shaughnessy, Beng. Disp.*, p. 617.)

Dof " " " " " "

Habitat—A large shrub or small tree found on the Himalaya from the Indus to Bhutan between altitudes of 3000 and 10,000 feet also on

DAMMARA
orientalis.

The Pines.

DAMMARA, *Lamb.*; *Gen. Pl.*, III., 436; *Fl. Br. Ind.*, V., 650.

Lambert (*Genus Pinus*, smaller edition) accepted Salisbury's position in separating the species of Dammar from the genus PINUS; he, however, preferred the name *Dammara*, *Rumph.*, to *Agathis*, *Salisb.*, the result being that *Dammara* has become better known. In a work like the present, which is more or less of a commercial character, it has been thought desirable to preserve the older name *Dammara*, and as *Agathis* has not been dealt with in the first volume of this work, it becomes all the more necessary to give the economic information in the present place. The *Flora of British India* adopts *Agathis* in preference to *Dammara*.

109

Dammara australis, *Lamb.*; *Genus Pinus*, t. 54.

THE KAURI PINE.

Syn.—AGATHIS AUSTRALIS, *Salisb.*

References.—*Gordon, Pinetum*, 108; *Gamble, Man. Timb.*, 394; *Indian Forester*, III., 177, 184; V., 104; VII., 363; XII., 476, 553; *Mysore and Coorg Gaz.*, I., 66; *Smith, Dict. Econ. Pl.*, 149; *Royle, Productive Resources*, 68; *Mueller, Extra-Tropical Pl.*, 102; *Beddome, Fl. Sylv.*, 227; *Trans. Agri-Hort. Soc.*, V., 110; VI., 103—105.

Habitat.—A native of New Zealand, now confined to the North Island, but formerly more extensively distributed. Cultivated in most tropical and sub-tropical countries. The tree is being experimentally cultivated in India, but apparently not with the vigour which the importance of the subject deserves. *Royle* alludes to a consignment of 353lb of seed of Dammar having been consigned to India in 1796, and in *Mysore* the descendants (presumably) of this stock may still be seen. *Beddome* alludes to *Dammara* as represented on the mountains of Madras.

RESIN.
. 110

Resin.—In the above remarks regarding Dammar resin some of the main features of the trade have been indicated. In *Lambert's* work, quoted above, is reproduced *Rumphius'* interesting article on the subject, one of the most important which has as yet appeared. Some idea of the value of the resin may be obtained from the fact that the imports into Great Britain are stated to have been worth £200,000. The tree is rapidly being exterminated in New Zealand, as its timber is of great value, and it is problematic how long the supply of fossil resin will continue to meet the growing demand. The tree attains a height of 120 to 150 feet, with a circumference of 24 feet.

THE AMBOYNA PINE.

Syn.—D. ALBA, *Rumph.*; AGATHIS LORANTHIFOLIA, *Salisb.*; *Fl. Br. Ind.*, V., 650.

Vern.—Theet-men (according to Mason), BURM.

Habitat.—A large tree, native of Amboyna, and Ternate, of the islands of Molucca, Java, Borneo, &c. *Mason*, in his list of the plants of Burma, enumerates this species, but *Kurz* makes no mention of it. *Wallich* states that it is found in Tavoy, and the *Flora of British India* that it is a native of Penang and Perak.

RESIN.
112

Resin.—The timber is of little value, but the tree affords large quantities of a transparent resin known as Dammar. This is conveyed to most parts of the world, being used in India as incense and for medicinal purposes. In Europe it is largely used like the resin of the above species for purposes of varnishing and for waxing or polishing fabrics. (*O'Shaughnessy, Beng. Disp.*, p. 617.)

The Nepal Paper Plant.

the Khásia and Naga Hills; one of the most abundant bushes on the hills between Manipur and Burma.

Gamble remarks that this species blossoms from November to February, and that the fruits ripen and become red in May. He adds that the flowers are "exceedingly sweetly scented" (*List of Darjeeling Trees, &c., p. 67*). Brandis says it flowers in "March and April, also in autumn," but he makes no mention of its being sweetly scented. The synonym *D. odora*, Don, would most probably imply that the flowers were scented. In the Simla district this species flowers from the middle of December to the end of February or middle of March, but the flowers are then devoid of any smell. It is probable that under certain circumstances it may have two seasons of flowering, in one of which it may be scented. Most authors describe the plant as "a large shrub," and Brandis says it attains a height of seven to eight feet. In Simla it is one of the most abundant plants, with *Skimmia Laureola* and *Sarcococca pruniformis* forming the forest under-brushwood, but none of these plants much exceed three feet in height.

FIBRE.
Bark.
110

Fibre.—The well-known Nepál paper is said to be made from the BARK of this and the other species of *Daphne*, and of the allied plant, *Edgeworthia Gardneri*. European interest in this paper may be stated to have originated in Lord Auckland's enquiry regarding it in the year 1837. It was of course known to the natives of India for several centuries prior to that date, and official records, on daphne paper, dated 1817, were submitted to His Lordship for inspection. Very little has since been added to our knowledge of the subject, and the reports quoted below were first published about the beginning of the present century.

"The process of making paper from this plant is thus described in the *Asiatic Researches*. After scraping the outer surface of the bark, what remains is boiled in water with a small quantity of oak-ashes. After the boiling it is washed and beaten to a pulp on a stone. It is then spread on moulds or frames made of bamboo mats. The *Setturosa*, or paper shrub, says the same writer in the above Journal, is found on the most exposed parts of the mountains, and those the most elevated and covered with snow throughout the province of Kumáon. In traversing the oak-forests between Bhumtah and Ranigur, and again from Almorah to Chimpanat and down towards the river, the paper-plant would appear to thrive luxuriantly only where the oak grows. The paper prepared from its bark is particularly suited for cartridges, being strong, tough, not liable to crack or break, however much bent or folded, proof against being moth-eaten, and not subject to damp from any change in the weather; besides, if drenched or left in water any considerable time, it will not rot. It is invariably used all over Kumáon, and is in great request in many parts of the plains, for the purpose of writing *misub-namaks* or genealogical records, deeds, &c., from its extraordinary durability. It is generally made about one yard square, and of three different qualities. The best sort is retailed at the rate of 40 sheets for a rupee, and at whole-sale 80 sheets. The second is retailed at the rate of 50 sheets for a rupee, and 100 at wholesale. The third, of a much smaller size, is retailed at 140 sheets, and wholesale 160 sheets to 170 for a rupee" (*Drury, U. Pl., 178*.)

Setturosa.
117

Cartridges.
118

Another early account of *Daphne* paper and the process of its manufacture is that given by the late Mr. B. H. Hodgson (*Jour. As. Soc. Beng., Vol. I., 8*), then Resident at the Court of Nepál. In describing this industry (which differs but little from that pursued with ordinary paper-making in India), it may suffice to indicate briefly the main features of Mr. Hodgson's account of the process, materials, and manipulation. The reader, however, will find Mr. Hodgson's complete article

D. 118

The Nepal Paper Plant

(G Watt)

DAPHNE

reproduced in Atkinson's *Himalayan Districts*, page 795, also in the
Trans Agri-Hort Soc Ind, V., 228-231

FIBRE

Mr Hodgson says a stone mortar is required and a mallet or pestle
of hard wood, proportioned to the mortar and the quantity of bark it is
desired to pulp. The alkali employed is the ash of oak-wood. This is

solution

The boiling is then continued for half an hour, when the alkaline juice
will be found to be nearly absorbed and the bark quite soft. This is now
carried to the stone mortar and beaten with the mallet until reduced to

durable as leather, and quite smooth enough to write on. For office records, he says it is incomparably better than any Indian paper. It is occasionally poisoned by being washed with preparations of arsenic in order to prevent the destruction caused by insects. Many of the books of Nepal, written on this paper, are said to be of considerable age, and the art of making the paper seems to have been introduced about 500 years ago from China, and not from India." "The paper," he continues, "is so pliable, elastic, and durable, that it does not wear at the folds during twenty years, whereas English paper, especially when eight or ten sheets are folded up into one packet, does not stand keeping in this state uninjured for more than four or five years." He then refers to a copy of a Sanskrit work which he inspected, the date of transcription of which was A.D. 1687, or 150 years prior to his writing of it, that it was in a "perfect state of preservation, having all that time withstood the ravages of insects and the wear and tear of use."

The writer had the pleasure recently to receive from Dr. Gimlette, Residency Surgeon, Nepal, some interesting facts regarding Nepal economic products and industries. The following passage, as supplementing the facts derived from the earlier writers (briefly reviewed above) may be here taken from Dr. Gimlette's account of paper-making:—"This paper, justly celebrated for its toughness and durability, is manufactured from two or three forms of *Daphne* and also from *Edgeworthia Gardneri*, the last mentioned producing the finest and whitest paper. It is manufactured by the cis-alpine Bhotias, who inhabit the mountains between Nepal proper and Thibet. The barks of the different species are generally mixed together, that of *Daphne papyracea* being seldom used alone except for cordage. *Shosho*, *arbadi*, *shedbarwa*, or *letbarwa*, are names given by the Bhotias to the *Daphne* shrubs; *Kaghuti*, *bara kaghuti*, and *chota kaghuti* are names also used, but all seem to be somewhat loosely applied." "The paper sells in the Katmandu bazar at the rate of six annas per twenty-four large sheets." Dr. Campbell reported in 1837 that the price was then 160 sheets, per Nepalese rupee, to 400; or from 9 to 13 Company's rupees per maund. The transport to Patna (a distance of 200 miles) he estimated at Rs. 12, and the price in Patna only a little more than in Catmandoo. This latter fact he explains by the circumstance of there being a monopoly of the sale of paper kept up by the Nepalese Government.

Throughout the greater part of India *Daphne* paper may be purchased, so that the manufacture by the hill tribes must be very extensive. Around Simla it is not made; indeed, the people seem utterly ignorant of the value of the plant—one of the commonest of wild plants. They prefer to make their ropes from *Grewia oppositifolia*, and alike neglect the *Daphne* and the wild hemp. This seems to be the state of affairs on most of the outer ranges. At Nagkanda (some 40 miles to the north of Simla) the writer came across some men carrying loads of *Daphne* bark, and was told it was being carried to the east where it was made into paper. This fact is in support of Stewart's statement that the Panjab Himalayan tribes do not make the paper, though it is well known to be extensively made in Kumáon. The Forest Officer of Jaunsar reports that, though the plant is very common in all the forests above 5,000 feet, paper is not made of its bark, but that the local supply used for Patwari maps, &c., is imported from Kumáon. Mr. G. G. Minniken, Forest Officer of Bashahr, recently informed the writer that *Daphne cannabina* was not used in his district for paper-making, though it was probably exported to be used as an adulterant.

Chemistry of *Daphne*.—In the chemical analysis of the fibres of India, published by Messrs. Cross, Bevan, and King, *Daphne* is placed

The Nepal Paper Plant.

(G Watt)

DAPHNE
cannabinaria.

CHEMISTRY.

at the bottom of the list, since it possesses, of all the Indian fibres examined by these gentlemen, the lowest amount of cellulose, namely, 22.3 per cent. Chemistry, in the verdict of percentage of cellulose as an indicator of merit, is thus in opposition to practical experience, for, although it would not perhaps pay to export the bark or paper half-stuff of this (or, indeed, of any other plant) to Europe for the paper-making industry, *pure and simple*, there can be hardly any room for doubt but that the *Daphnes* in many respects are the best of all Indian paper materials. The chemical test given above may, however, be accepted as demonstrating their unsuitability for textile purposes. In *Spons' Encyclopædia* (Vol. I, 947) an old report regarding the fibre is reproduced, namely—"The inner bark, prepared like hemp, affords a very superior paper material. The paper made from it is particularly suitable for cartridges because strong, tough, and not liable to crack or being moth eaten, or left in water request locally

for writing deeds and records on, being quite smooth, and almost indestructible. It may, however, be pointed out that the process described above (by means of which the hill tribes manufacture their *Daphne* paper) is one mainly characterised by the very slight amount of alkali necessary to produce the pulp. A crude alkaline ash, with the boiling conducted for only half an hour, and that too in an open vessel, is all that is necessary. Such a treatment may not completely reduce the fibre, though it proves sufficient to produce a workable pulp. Messrs Cross, Bevan, and King urge that the only safe criterion of the merits of a fibre is obtained from the percentage of cellulose, and that because *Daphne* could be the most

percentage of cellulose, and thus seems to call for extended research, since chemistry must undoubtedly be able to account for this fact. It would almost seem as if the expeditious and wholesale modern methods of paper making, indeed of fibre extraction generally, removed the materials of vascular concretion or disturbed conditions of the ultimate cellulose fibrils that were essential to their strength as textile or paper materials. The loss by weight and the injury to strength effected by a strong boiling alkali, and under a high pressure, does not seem a conclusive proof that, with some other process, the fibre thus condemned would not be found to possess properties of great merit. At all events, *Daphne* paper, as made in India, will endure for many years under a treatment that, in a few weeks, days, or even hours, would render the modern papers produced in Europe perfectly worthless.

The following are the results of the analysis of the *Daphne* paper made by Messrs Cross, Bevan, and King.

13.6 per cent, ash 3.9, loss by hydrolysis, for five minutes, in soda alkali 21.6, for one hour 34.7, amount of cellulose 58.5 per cent, mercerising 16.5, increase of weight on nitration 12.6, loss by acid purification 8.3, amount of carbon 41.8 per cent. It is to be regretted that these chemists did not furnish a similar complete report of *Daphne* so as to allow of comparison. They seem to have been so disappointed with the low per-

are succeeded by red berries. Although it is occasionally met with in Britain, by most writers it is there viewed as an introduced plant.

HISTORY.
125

said to be of Greek and not Arabic origin, and the plant referred to is thought to be the *Daphne Mezereum* of botanists. At all events, that plant has held a place in European medicine for the past several centuries.

Kamela which Irvine and other modern Indian authors refer to *Daphne Mezereum* is not the Mezereon of European writers. Irvine remarks that "the seeds are imported from Cabul and used as an irritant." In another place he again reverts to the subject of *Daphne Mezereum*, but calls it the *Mameera*, and states that "this root is like Mezereon and used in the same way." On a still further page, and again under *Daphne Mezereum*, he gives another account, calling the plant (in the vernacular) by the names of *Ugul-ool* and *Mazrioon*. "The root," he says, "brought from Persia is used as a stimulant sudorific." (Conf. with remark under *D. oleoides*, para MEDICINE). Dr. Dymock (under *Mazariyun*) gives an account of the drug as described by Mir Muhammad Husain, but makes no mention of any drugs sold at the present day in Bombay drug shops under that name. Assistant Surgeon Sakharum Arjun,

The above vernacular names are given by most authors under the old synonym of *D. mucronata*.

References.—*Brandis*, *For. Fl.*, 385; *Gamble*, *Man. Timb.*, 315; *Stewart*, *Pb. Pl.*, 189; *Aitchison*, *Cat. Pb. and Sind Pl.*, 130; *Aitchison*, *Kuram Valley Flora* (*Jour. Linn. Soc.*, XVIII.), 25; *Baden Powell*, *Pb. Pr.*, 577; *Atkinson*, *Him. Dist.*, 574; *Royle*, *Ill. Him. Bot.*, 321.

Habitat.—A small much branched shrub, met with on the Western Himálaya, from Garhwál westward to Murree, the Suliman Range, and Afghánistán, occurring at altitudes of from 3,000 to 9,000 feet.

Regarding the season of flowering of this species there seems to be some confusion. *Brandis* says that it occurs in September and October; and the fruits, which are orange or scarlet, mature in May and June. As if to contrast this statement with an error made by *Stewart* he gives the following paranthetic quotation ("blossoms May-July, at times October, the fruit usually ripening June-October"—*Stewart*). *Gamble* refers to the plant as met with in the Simla District: if it does so, it must be extremely rare. The writer has not as yet come across it in Simla, but with reference to the season of flowering he has samples of the plant from Quetta in full flower and dated May, and from Pangl, dated June.

Medicine.—*Aitchison*, in his *Flora of Kuram Valley*, says that the ROOTS of this plant are used internally, when boiled, as a medicine, being purgative. In another place he says: "Camels will not eat this shrub except when very hungry. It is poisonous, producing violent diarrhoea. I feel certain that much of the mortality of camels in the Kuram division was due to the prevalence of this shrub."

The BARK and LEAVES are used in native medicine. The BERRIES are eaten to induce nausea. *Stewart* refers to this plant as hurtful to camels, thus making the same observation as recorded by *Aitchison*. *Stewart* further says the bark is used by women in Kanáwar for washing their hair, and adds that it has been tried for paper-making.

It seems highly probable that the *Mezereum* which *Irvine* and other writers mention as imported into India from Afghánistán and Persia is this plant and not the true *D. Mezereum*.

Spirit.—*Brandis* says that on the Sutlej a spirit is distilled from the BERRIES..

Habitat.—A tall, erect herb, resembling hemp, hence the specific name. It is met with in the temperate and sub-tropical Western Himalaya from Kashmir to Nepâl, at altitudes from 1,000 to 6,000 feet, but is by no means a plentiful plant. Dr. Dymock says: "The plant is a native of Sind." This seems highly doubtful.

DYE.
145

Dye.—Many writers allude to this as a special dye used in Kashmir to dye silk a delicate yellow colour. Throughout the Himalaya it is more or less employed, being combined, it is said, with red colours to soften the tint, and with indigo to produce a favourite green (*pista*). Stewart writes: "In some of the places where it grows, the yellow root is used to aid dyeing red, and Cleghorn states that it is exported from Pangi, Lahore, and Kullû, to Nadoun and Amritsar to be used in dyeing woollen threads. Edgeworth mentions that for this purpose it is combined with *asbarga* (*Delphinium saniculæfolium* [or rather *D. Zalil*,—*Ed.*]). In a recent report furnished by the Conservator of Forests, North-West Provinces, it is stated that the dye-stuff is exported from the Himalayas to the plains to be used both as a dye and medicine.

The parts employed are the yellowish wood, bark, and root.

SPECIAL OPINIONS.—§ "Used extensively as a dye, for which purpose it is exported from Kashmir" (*Surgeon-Major F. E. T. Aitchison*). "*Datisca cannabina* (*akalbîr*) is found sparsely scattered throughout the forest of the upper Kunawur, and more plentifully to the west of Wangtû, particularly in the Saldung Valley. It is known as producing a yellow dye, and the roots sell at Amritsar for Rs 14 per maund of 80lb. In August the roots are dug up (the bark peeled off), dried in the sun, and then packed for export to Rampur or Amritsar. About 200 to 300 maunds are obtained annually in Bashahr on the Sutlej. It is not known if any be sent from the Rupin and Paber Valleys. One root yields from $\frac{1}{2}$ to 1 seer. The seed or flowers are of no use as far as is known" (*G. G. Minniken, Esq., Assistant Conservator of Forests, Bashahr*).

MEDICINE.
146

Medicine.—Medicinally, it acts as a sedative in rheumatism. As a bitter and purgative, it is used sometimes in fevers and in gastric and scrofulous complaints. In intermittent fevers, it is administered in doses of from 5 to 15 grains (*Dymock*, *Mat. Med. West. Ind.*, 1st Ed.). In the second edition of his work Dr. Dymock seems to have modified slightly his statements regarding the drug, but adds that in "Khagan the bruise"

D. 146

The Akalbur

(G Watt.)

DATURA.

ROOT is applied to the head as a sedative" Balfour says it is used as an expectorant in catarrh "The BARK also contains a bitter principle like quassia"

Chemistry—The peculiar property of the dye principle of this plant does not seem to have been worked out, and results of some interest may be expected from its thorough examination Dr Warden (Professor of Chemistry, Calcutta), in reply to an enquiry on this subject, furnished the following brief note—

"It contains a glucoside, datscin, which crystallises in colourless needles or laminæ It forms with alkalis a deep yellow solution, and, accord-

in alcohol, and the remaining traces of resin removed by re precipitation with water Datscin may then be obtained in colourless silky needles or scales, little soluble in cold water, and only sparingly so in warm water and ether The crystals are neutral and have a bitter taste, they melt at 180° C." (Wurtz, *Dict de Chem*, t I, 1134)

DATURA, Linn ; Gen. Pl., II., 901.

150

By some writers *Datura Stramonium* is supposed to be the *στρούχνος μανικός* of Theophrastus and Dioscorides This, however, seems open to doubt, as the descriptions of the plant alluded to by these classical authors do not justify such an opinion It is, indeed, doubtful if even *Stramonium* was known dur-

τατουλα, a

Muhamma

the name

the Persian

given to it in Southern India *Ummittak-kay* comes from the Sanskrit synonym *Ummatta*

The Arabic and Sanskrit literatures fully establish an ancient knowledge of the properties of the drug But so much difference of opinion prevails amongst modern writers on the medicinal as well as non-medicinal forms that time is lost of place here to deal exhaustively on

certainly not specific Writers who speak of the purple flowered being a more powerful poison than the white, may have originally got their ideas from an ascertained fact, namely, that a form, one of the characters of which was to have flowers of that colour, had the poisonous property highly developed But any of the Indian species or varieties may have purplish

D. 150

DATURA.

Colour of the Flowers of Datura.

HISTORY.

flowers. Indeed, *D. alba*, a name formerly given to what is now treated as a variety of *D. fastuosa*, has often purplish flowers. So, again, *D. Metel* has generally white flowers, but sometimes they are purplish. Either of these species may, however, have been the white-flowered datura of the early writers; and very probably it was *D. Metel* that was their less poisonous white-flowered datura and not *D. alba* as supposed by most modern authors. It thus follows that nothing could be more misleading than to base an opinion as to the merits of a datura simply because of its flowers being purple or white. Few plants could generically be more easily recognised than the *daturas*. The long-plaited corolla and inflated calyx, the latter separating transversely on fertilisation so as to leave a collar around the base of the thorny fruit, are unmistakable characters. And these characters are peculiar to all the forms, but cultivation may modify the colour of the flower or even double the flower—one corolla appearing to grow from the interior of the other. How far the chemical properties of the plants are affected by selection or care in cultivation it is impossible to discover. But one thing is certain, that the *daturas* have been and are to some extent cultivated, and many of the peculiar forms met with in certain localities are most probably escapes from a former cultivation. Indeed, it is scarcely possible to avoid the conviction that cultivation has had far more to say to the peculiarities of the *daturas* than is generally believed. In a great many Indian localities the plant appears at most only semi-wild, and has all the appearances of being the degenerated offspring of a cultivated stock, once upon a time much more generally cared for than at the present day. There are, for example, numerous forms known to the native expert that would be utterly unrecognisable in the herbarium. Like the forms of *Aconitum Napellus* some of these are poisonous and others comparatively innocuous. The shepherd will dig up and eat one form of *Aconite* but eschew another, recognising it as a virulent poison. But to the botanist they are indistinguishable. This same knowledge is prevalent regarding the forms of datura. That we should longer remain entirely ignorant of these facts is doubly to be regretted, since we are alike unable to check criminal abuse and to take full advantage medically of the meritorious forms.

As sold in the Indian bazars, datura should be used with the greatest caution. It would richly repay any person having the opportunity and leisure to prosecute such researches, to cultivate in India side by side all the forms known to the natives, and having critically examined and described these, to have them subjected to chemical analysis. It might then be possible to establish some more trustworthy standard by which to differentiate the *daturas* than we possess at present. Such a study might not reveal a more extensive series of varieties and cultivated forms than is supposed to exist; but that the specific distinctions recognised by botanists would thereby be broken down seems highly likely. Possibly all the Indian *daturas* constitute but one or at most two species. The differences currently admitted are scarcely more than what in most other genera would be attributed to climatic causes. *Datura Stramonium* might be called the type of the temperate or alpine series, and *D. fastuosa* that of the tropical or plains assemblage. Some of the conditions of the former, like some of those of the latter, have blueish flowers; certain are recognised as virulent poisons, others sufficiently less so to be employed neither criminally nor medicinally. M. Naudin devoted much careful study to the species of *Datura*, cultivating all those of which he could procure the seeds. It is recorded that Dr. George Bidie, C.I.E., of Madras, sent seeds of *D. alba* to Professor Flückiger, and that these were handed over to Naudin. As the result, plants, *first*, of the true *D. alba*, were obtained; *second*, plants with flowers white inside and violet outside; *third*, plants with double corollas of a large

The Datura Poison	(G Watt)	DATURA.
size and yellow colour It is remarkable that these should all be said to		HISTORY.

a confession of defective knowledge, and an appeal for more critical study. The reader is referred to the remarks below (under each species) for a brief description of the forms commonly recognised. But before passing from this introductory account it may be as well to allude to one or two authors whose writings deserve consideration, although it is impossible to decide to what particular species or form they more especially allude. Garcia de Orta visited India in 1534 and became physician to the hospi-

hearbe called Deutroa which beareth a seed, whereof brusing out the sap they put it into a cup or other vessel and give it to their husbands, eyther in meate or drinke and pre hee were halfe out of his wits, and w nothing but) laugh, and sometime lieth) like a dead man, so that in will and take their pleasure with their friends, and the husband never know of it. In which sort he continueth foure and twentie hours long, but if they wash his feete with colde water hee presently reviveth and knoweth nothing thereof but thinketh he had slept." Commenting on Linschoten's account of the drug his contemporary Paludanus states that "*Deutroa* of some called *Tacula*" (a misprint for *tatula*), "of others *Datura*, in Spanish *Burla Dora*, in Dutch *Igell Kolban*, in Malaha *Vumata Caya*, in Canara *Datura* in Arabic, *Marana*" (the Arabian name is *Faus masal*) "in Persian and Turkie *Datula*. Of the description of his hearbe and fruit you or eatheth but half a dr his wits and taken with quently recurs to *datura* in abundance, and altho never-the-less those that dayly eat thereof, &c." enlarges at great length on the various criminal uses of the drug, he makes no mention of the medicinal.

The *Makhsan* recommends preference to be given to the purple flowered *datura*. The parts of the plant are the following account of looks at appears dark, he remarks that he really sees all the usual impressions of

DATURA
fastuosa.

The Black Datura.

HISTORY.

variety is specified, as, for example, in a prescription for insanity, quoted below. *Dhatūrā* leaves are used in smoking by debauched devotees and others accustomed to the use of *gānjā*. The seeds are added to the preparations of *bhāṅg* (leaves of *Cannabis sativa*) used by natives for increasing their intoxicating powers. The use of the powdered seeds in sweetmeats, curry powder, &c., for the purpose of stupefying travellers and then robbing them is well known." Further on, Dutt says of the habit of smoking the leaves as a cure for spasmodic asthma: "I have not met with any written prescription for it in Sanskrit or vernacular medical works, nor does the *Taleef Shereef* allude to the practice as known to the Mussulman Hakims. It would seem, therefore, that this use of the drug is of recent origin." Smokers of *gānjā*, however, as is well known, suffer from violent fits of a kind of false asthma, so that the habit of smoking the leaves by devotees, &c., to which Dutt alludes is practically a recognition of the property the knowledge of which he excludes the early Sanskrit authors from possessing. In the passage quoted above it may be doubted whether Dutt is narrating his own knowledge of the modern employment of the leaves or is quoting the opinions of Sanskrit writers. The point is of considerable historic interest. Ainslie found that the natives of South India, during his time (1820), were unacquainted with the value of the leaves in the cure of asthma, and it is commonly stated by writers on the subject that the discovery of this property is due to European medical science.

(G Watt)

DATURA
fastuosa.

said to occur in Chindwin Valley, Kyaukpadaung Mandalay Upper Burma, Toungoo, Ruby Mines, and Bhamo districts, Special Report from Bengal, where the plant is said to be often grown in gardens

Habitat—A small shrub found all over the tropical parts of India, in waste places. There are said to be two types of this plant, the type being ascertained by the colour of the corolla, white or purplish, large, corolla of the mouth which is sometimes 5 inches across. The flower frequently seen to be double and roundish (not ovate) spinose all over, stalk recurving with maturity until the fruit becomes pendent. When the seeds are ripe the fruit opens irregularly, forming a few short valves.

This is very generally reputed to be the most virulent form of the

Makhan gives preference to the purple-flowered datura (presumably *D. fastuosa*), but according to Dutt the Sanskrit writers do not make any distinction in the properties of the two plants, though the white form (*D. alba*) is recommended to be used for insanity. Dalzell and Gibson say there are several well known varieties of *D. alba*. They, however, make no mention of these being used medicinally. Of *D. Hummatu* (= *D. fastuosa*) they remark that in Bombay it is almost as common as the preceding. They then add "These plants are intoxicating and narcotic; the root is used in violent headaches and epilepsy, poultices are made of the leaves for repelling cutaneous humours, the bruised seeds are ap-

of these and of *D. Stramonium*, that we are enabled to infer that they contain the alkaloid *Daturine*.

But it may be added that *D. fastuosa* is so universally believed to be stronger than *D. alba* or *D. Metel*, that it is preferentially used by the criminal classes.

Criminal Purposes—Considered by some of the native doctors a better variety than the white, the *Pharmacopæia of India* affirms that there is no foundation for this opinion. The SEEDS constitute a favourite

CRIMINAL
PURPOSESSeeds
152

the liquor is thrown into them and the mouth covered over for a night. It seems remarkable that when thus burned the smoke should retain its poisonous and intoxicating properties. Dr Dymock states that in

DATURA
fastuosa.

The Black Datura.

CRIMINAL
PURPOSES.

Bombay the smoke from the seeds burned over charcoal is also used to make liquor intoxicating. Mr. H. Sewell, Collector of Cuddapah, reports: "This is known as *Umatai* in Tamil. There are two species—white and black. Both grow wild and are not cultivated. The former is not used for any purpose. For mixing with intoxicating beverages, for instance toddy, the latter is useful. Its seeds are soaked in that liquor along with a quantity of poppy seeds ground to a paste. The mixture is then strained and mixed with fresh-drawn toddy, which gives the latter intoxicating power. It is not possible to estimate the quantity of datura seed consumed in this way." Mr. Baden Powell (*Pb. Prod.*, I., 207) alludes to a series of samples shown in the Lahore Museum as illustrative of the criminal methods of using the drug in Upper India. He says (quoting from a report on these written in 1863): "The series consists of the seeds of the plant in their raw state, seeds roasted, essence of the seeds, atta (flour) drugged with the poison, sugar ditto, and tobacco ditto." He then remarks this is the agent used by the "Thugs" to stupefy their victims. "Both kinds of the dhatura, the white and the purple, are used, but the white (*sic*) is considered the most efficient." "For poisoning purposes the seeds are parched and reduced to a fine powder: thus it is easily mixed with sugar, atta, tobacco, &c. Also the professionals distil the seeds with water, forming a powerful essence; ten drops of this is sufficient if put into a *chillam* of the *huka* to render a man insensible for two days. The taste is acrid and bitter, and soon followed by a burning suffocating sensation. It is very difficult to detect in a *post mortem* examination. The victims are usually discovered in a state of insensibility, and breathing hard and heavily; if removed, care should be taken not to expose them to the heat of the sun, which is fatal. The action of the poison is quicker in the hot weather than in the cold; much, of course, depends on the individual constitution of the victim, but usually in hot weather it begins to work in five minutes, coma supervening within the hour. In cold weather it begins to act in a quarter of an hour or twenty minutes."

MEDICINE.
153

Medicine.—For Medical uses proper, see under *var. alba*.

SPECIAL MEDICAL OPINIONS RECORDED UNDER *D. fastuosa*.§—"The form of datura with blue flowers is considered stronger than the white kind. No doubt this drug prevents hydrophobia. There are persons here and therein this district who are considered professors in curing hydrophobia. But none of them will reveal the secret of the medicine used. With great pains and labour I discovered this remedy. I have myself treated many cases successfully, and some of my pupils have been equally successful. My treatment consists in giving the medicine previous to the time of the development of hydrophobia."

"It is usually found that hydrophobia comes forty days after the patient has been bitten by the mad dog (except some rare cases which I have known to happen within two or three weeks). My treatment is to give the following medicine two weeks after the patient has been bitten, *i.e.*, between the fifteenth and twenty-fifth days. In the morning after the fifteenth day of the bite, about six o'clock, give a dessert spoonful of tea wood-charcoal powder. (This seems to be given lest the poison of the juice overcomes the patient.) Half an hour after give an ounce of the JUICE of the black datura leaves. Soon after follow with Palmyra jaggery or something else in order to check vomiting. Then, bind the person lest he does mischief to others, and keep him in the sun for four or five hours, until midday. Then, the person gradually becomes mad, and does many things like the mad dog (when these symptoms appear, it is evident that the patient had been really bitten by a mad dog, and that he will totally recover). In the afternoon pour many pots of cold water over the head. This causes

datura is recommended in the cure of supposed mad dog bites. The English of the original has been slightly altered and superfluous matter removed, but the principle and method of treatment has been faithfully preserved [Ed., Dictionary, Economic Products.]

"I have used this drug pretty extensively. In painful swellings I apply the JUICE of fresh leaves, or make a poultice of them. The fresh juice in ophthalmic pain I find very useful, it checks the inflammation if there be any. Inhalation of the smoke of the burning DRY LEAVES and TWIGS is always useful in asthmatic fits. Smoking the powdered dry leaves and twigs relieves the spasm, but when smoked in excess brings on giddiness and fainting. The seeds are said to be useful in cases of hydrophobia, and the anther in cholera" (Civil Surgeon D. Basu, Faridpur, Bengal). "The dried ROOT of the plant I have frequently used, as smoking, to relieve fits of asthma" (Nundo Lall Ghose, Bankipur). "In ear-ache the fresh juice of the leaves is useful, a drop or two poured inside the ear" (Assistant Surgeon T. N. Ghose, Meerut). "The dried

efficacious when applied over painful glandular swellings" (Assistant Surgeon Shib Chandra). "The root of the above, in the N.-W. Provinces

The seeds are also employed by them for impotence in the following way: seeds of 15 fruits dried and pounded are well boiled in ten seers of cow's milk, out of this milk as much ghee as possible is made, this ghee is believed to contain strong aphrodisiac properties, and is rubbed on the genitals twice a day, to stimulate them, and about four grains of the ghee is also given internally once a day (Assistant Surgeon Nobin Chunder Dutt, Dhurbhanga). "In Mysore the juice of the leaves is given once daily with curdled milk for gonorrhoea" (Surgeon Major John North, I.M.S., Bangalore). "Have used the leaves warmed over a fire nightly as an external anæsthetic in rheumatism" (Dr. Picachy, Civil Medical Officer, Purneah). "The leaves are useful as a local application in rheumatism. The concentrated juice of the leaves is prescribed in mumps as a

DATURA

local application, and has a marked effect in reducing the swelling and tenderness" (*Narain Misser, Kathe Bazar Dispensary, Hoshangabad, Central Provinces*). "An extract made from the seeds is a good mydriatic, and the leaves are used as emollient and suppurative" (*Honorary Surgeon Easton Alfred Morris, in Medical charge, Tranquebar*). "The leaves of this plant are boiled, made into a poultice, and applied locally to boils and abscesses to relieve pain and hasten suppuration" (*Surgeon W. F. Thomas, Mangalore*). "A few seeds with *ugargarha* (*Anacylus Pyrethrum*) root and cloves are chewed as an aphrodisiac" (*Dr. Emerson*). "A paste composed of datura and turmeric is useful in checking inflammation of the breasts" (*Civil Surgeon J. Anderson, M.B., Bijnor*). "The juice of the leaves is a good substitute for *Belladonna*" (*Surgeon Major P. N. Mookerjee, Cuttack, Orissa*).

NOTE.—It is doubtful how far the vernacular names given by authors for *D. fastuosa* and *D. alba* can be regarded as specific, since either forms may have white or blue flowers. Indeed, these plants have more generic than specific names, the simple equivalents of *Datura* of the plains as the names given by the hill tribes are but further synonyms, though given to the form met with in the higher regions, viz., *D. Stramonium*.

References.—*Flora Andhrica*, 48, 186; *Mason's Burma*, 488, 798; *Pharm. Ind.*, 175, 460; *Ainslie, Mat. Ind.*, I., 442; *O'Shaughnessy, Beng. Dispens.*, 469; *Moodeen Sheriff, Suppl. Pharm. Cuddapah*, 200; *Orissa Gas.*, II., 180; *Gas., Mysore and Coorg*, I., 56; *Gas., N.-W. P. (Meerut)*, II., 506, III., 81.

Habitat.—A large, spreading annual, two to four feet high, found like the type form of the species throughout the warmer parts of India, though it only rarely ascends above 3,000 feet. This form doubtfully deserves the rank of a variety. The characters of the flower and fruit are almost identical with that already given, except that they are smaller, the teeth of the calyx being less than half the size of those in *D. fastuosa*, and almost lanceolate-acuminate instead of ovate-acuminate. Flowers white or slightly bluish outside.

If anything this is even more abundant, and fortunately so, for it is very generally reputed to be less virulent than the black *dhatúra*.

Medicine.—The properties of the Indian plains *Datura* are supposed to be practically identical with those of *D. Stramonium* and analogous to those of *Belladonna*. The officinal parts are the SEEDS and the LEAVES: of the former a tincture, an extract, and a plaster are prepared, and of the latter a poultice, but the dried leaves are also smoked to relieve urgent symptoms in spasmodic asthma, the dyspnoea of phthisis, emphysema of the lungs, or even in chronic catarrh. The tincture and extract are sedative and narcotic; the former preparation by many writers is recommended as a useful and cheap substitute for opium, 20 drops of the

D. 162

MEDICINE.

Seeds.

161

Leaves.

162

The White Datura

DATURA
fastuosa.

MEDICINE

tincture being equal to a grain of opium. The latter has been frequently employed as a convenient substitute for extract of Belladonna the dose being a quarter of a grain, increased gradually to a grain and a half, thrice daily. Dr. Bidie suggests an extract from the leaves,

the larger dose in which it can be administered is an advantage. The plaster and the poultice are effectual local anodynes in case of nodes rheumatic enlargements of the joints, painful tumours or external piles. The plaster is frequently used on the chest in asthma and chronic pulmonary affections, but neither should be applied to ulcerated surfaces owing to the risk of absorption of the poison. Amongst native women a poultice of *datura* leaves is a favourite method of arresting the secretion of milk in cases of painful breasts. The active principle *daturine* in place of atropia has been proposed for ophthalmic purposes, but with comparatively little success. The effect of the administration of *datura* is to produce dilatation of the pupil "should it become very large and dilated this may be taken as a sign that the medicine has been carried as far as it can with safety, whether it has produced its other intended effects or not" (Waring, *Bas Med.*, 53).

Waring recommends it to be tried in tetanus (lock-jaw consequent on a wound) when other better remedies are not procurable. "A poultice of the leaves, renewed three or four times a day, should be kept constantly to the wound, which should be further cleansed if covered with thick discharge or slough by the process of irrigation of tepid water. The tincture of *datura*, doses of 20 to 30 drops in water, may also be given internally three or four times a day. The dose must be regulated by the effect produced, but it yield), till it produces diness, drowsiness, or carry the medicine.]

tant intervals, and are less severe and prolonged when they do occur, the medicine in smaller doses, at longer intervals, may be continued till the spasms cease altogether, but if, under the use of the remedy, after it has

The above may be viewed as a brief abstract of the current European medical uses of *datura*, but by the natives of India the drug is highly spoken of in the treatment of insanity, and of the painful headaches which often precede epilepsy and mania, and Ainslie mentions that Muhammadan doctors especially prescribe for these purposes a powder of the root in very small doses not exceeding a quarter of a grain increased to three grains. Ainslie adds that "Some of the S. people used the powdered

Root,
163

DATURA
fastuosa.

The White Datura.

MEDICINE.

spasmodic asthma, but most of all for the last complaint. Waring affirms that in some few cases it is not serviceable in asthma, but so frequently is it of great benefit that patients subject to chronic asthma should always keep a pipe filled and ready to light. Dymock remarks that "Sanskrit writers describe the plant as beneficial in mental derangements, fever with catarrhal and cerebral complications, diarrhoea, skin diseases depending upon the presence of animal parasites, painful tumours, inflammation of the breasts, &c. A pill made of the pounded seeds is placed in decayed teeth to relieve toothache, and the leaves are smoked along with tobacco in asthma. According to Dutt no mention of the latter use of the plant is to be found in old Hindu books. Muhammadan writers also are silent upon this point. Ainslie found upon enquiry that the physicians of Southern India were unacquainted with the value of datura in spasmodic asthma, but he tells us that his friend, Dr. Sherwood of Chittore, noticed the smoking of *D. fastuosa* as a remedy in that disease. In the Konkani the juice of *D. alba* is given with fresh curds in intermittent fever to the extent of one tola during the intermission, and at least two hours before the fever is expected." Ainslie (p. 637) mentions a case in which great relief was obtained in sciatica from an extract administered in one-eighth of a grain to grain doses. Drury states that a preparation of the leaves in oil is used in the cure of itch and rheumatic pains by being rubbed on to the part affected. In Sind, it is said that a poultice of the bruised leaves and rice flour is believed to relieve the pain and hasten the expulsion of guinea-worm. "The leaves of the white variety are sometimes chewed with the same object" (Murray). "In Rajputana mothers smear their breasts with the juice of the leaves to poison their new-born female children" (Drury). Mr. H. Z. Darrah, Director of Land Records and Agriculture, Assam, has furnished the following information regarding the daturas of the Assam Valley: "The Assamese *dhutara* is probably the *D. Stramonium*."—[This is most unlikely, since we have no knowledge of that species existing so far to the east; it is more than probable that one or two forms of *D. fastuosa*, or possibly also *D. Metel*, constitute the *dhutara* of Assam.—Ed.] "The white flower, the purple flowering, and also the yellowish-tinged variety, are met with growing wild in villages and waste places. A few plants are specially protected for medicinal use. It is known as a strong poison and to cause delirium. The dried leaves are rarely smoked, and then only as a remedy in illness, but the leaves are used as a paste and applied: the seeds are taken internally with other articles as a medicine, and sometimes the root is used. It is not used as an intoxicant. It is said, according to a popular idea, to be put as an ingredient into a medicine used to prevent hydrophobia after the bite of a mad dog, but is given carefully and in sufficient quantity only to produce delirium or madness, which is thought to take the place of the madness of the hydrophobia. It is said to be ineffectual when hydrophobia has begun." Mr. Sewell, Collector of Cuddapah, Madras, writes that two forms grow wild in his district—the white and the black; the former is not used for any purpose, but the latter is employed for making toddy intoxicating. "The leaf is smoked along with tobacco by asthmatic patients." Mr. H. Willock, Collector of Trichinopoly, while stating that one or two forms grow "in back-yards and gardens," adds "it is never smoked."

SPECIAL MEDICAL OPINIONS COMMUNICATED REGARDING *D. alba*—
 "The juice of the leaves I have frequently used to dilate the pupils with success" (Nundo Lal Ghose, Bankipur). "The leaves are employed as an external application in rheumatism, the joint being enveloped in the leaves of the castor oil plant afterwards" (Lal Mahomed, Hospital Assistant, Main Dispensary, Hoshangabad, Central Provinces). "I have

D. 164

DATURA
Stramonium.

Stramonium or Thorn Apple.

Habitat.—A herbaceous plant, found in the Western Himálaya and mountains of the West Deccan Peninsula; probably introduced into India. Fleming (*As. Res.*) in the passage quoted below affirms that this is a native of the Himálayas, and is the species met with in Kashmír. It is widely naturalised in the Old World and produces flowers and seeds the whole year.

This is a much more temperate species than the preceding, but in shape of flower and character of fruit can with difficulty be distinguished. The corolla possesses, however, 10 instead of 5 teeth or petals; the leaves are pubescent, and show a pronounced tendency to be cordate at the base. The stems are almost sub-villose, a character by which the plant may be recognised in the bazar product from all the other Indian daturas. It is a much smaller species than any of the others, its pubescence and 10-petalled corolla being its characteristic features.

MEDICINE.
165

Medicine.—Sir George Birdwood mentions this plant in his list of drugs of Bombay as if it were the *datura*. It possesses properties similar to those of the other species. Fleming (*As. Res.*, XI., 1840), gives it the names of *D'hatura*, HIND., and *D'hustura*, SANS., and refers to Murray, I., 670, and Woodville, II., 338, works which the writer has not the opportunity of consulting. In a further passage (quoted in full under *D. Stramonium*) Fleming holds that this is a native of India, and seems to concur with Linnæus, that it might be used in preference to *Stramonium*.

166

Datura Stramonium, Linn.; Fl. Br. Ind., IV., 242.

STRAMONIUM OF THORN APPLE.

Syn.—*DATURA FEROX*, Nees (the plant described by Madden as the *Kála dhatura* of Kumaon, Atkinson, *Him. Dist.*, p. 370); *D. WAL-LICHII*, Dunal; *STRAMONIUM VULGATUM*, Gærtn.

Vern.—By many writers this bears the same popular names as have already been given under *D. fastuosa*, var. *alba*, and if the suggestion that *D. Metel* is the white *datura* proves incorrect, this is much more likely to be the plant meant than the *D. alba* of Botanists. *Sada dhutúra*, BENG.; *Tattur*, *dattura*, PB.; *Kachola*, *datura*, AFG.; *Umatai*, TAM.; *Ummetta*, TEL.; *Datturi gida*, KAN.

References.—Stewart, *Pb. Pl.*, 156; O'Shaughnessy, *Beng. Dispens.*, 59; Balfour, *Cyclop.*, I., 897; Smith, *Dic.*, 152; Kew Off. *Guide to the Mus. of Ec. Bot.*, 100; Fleming, *Med. Pl. and Drugs in As. Res.*, Vol. XI., 165.

Habitat.—The temperate Himálaya from Baluchistan and Kashmír to Sikkim. It is distributed east and west along the outer Himálayas and thus covers a region of over 1,000 miles. Taking the neighbourhood of Simla as fairly representative of that area, it is very abundant around Simla, and is met with everywhere on the march north to Upper Kulu (a distance across the outer ranges of perhaps 150 miles); but everywhere it frequents road-sides and village sites, and but rarely is seen in the forests or on the wild uncultivated hills. In the deep valley of the Sutlej it is particularly plentiful, miles of country, as at Rampur, being literally covered with *Cassia Sophora*, *Cannabis sativa*, and *Datura*. It is often, however, difficult to say in these lower warm valleys, whether *D. fastuosa* or *D. Stramonium*, is the species present, since one plant may be found with the erect and the next with the nodding fruit. On the higher slopes no doubt need be entertained, as the plant there met with has the characteristic ovate, erect fruit bursting regularly into four valves for half of the entire length of the capsule. Although thus very abundant on the Himálayas, *Stramonium*, like the daturas

D. 166

D. Stramonium) is a peculiar attitude here

M. de Candolle's emphatic statement that it is not a native of the Himalayas, then must the further opinion be held that all the species of datura met with in India are introduced and acclimatised plants.

The botanical characters by which D. Stramonium may be recognised have been partly indicated above, but it may be as well to repeat these more fully. It is a more compact plant than D. fastuosa, more succulent and of a considerably paler green than the plant of the plains. The flowers are also much smaller, being only 1 to 3 inches in diameter, but
ly erect in the bifur-
It also bursts open

D. fastuosa (see page 33).

Towards the close of the sixteenth century D. Stramonium was introduced in England by

In his *Herbal* he cal

169

Hindústan,* but the *D. Metel* grows wild in every part of the country. The soporiferous and intoxicating qualities of the seeds are well known to the inhabitants, and it appears, from the records of the native Courts of Justice, that these seeds are still employed for the same licentious and wicked purposes as they were formerly in the time of Acosta and Rumphius (See *Rumph.*, *Amb. V.*, 242). I do not know that either the seeds, or the extract prepared from the expressed JUICE of the plant, are used in medicine here; but those who place any faith in the accounts given by Baron Stœrck, and Mr. Odhelius (*vide* Murray and Woodville) of the efficacy of the extract of the *Stramonium*, in the cure of mania, epilepsy, and other convulsive disorders, may reasonably expect the same effects from the extract of *Metel*, the narcotic power in the two species being perfectly alike. Linnæus, indeed, has given a place, in his *Materia Medica* to the *Metel*, in preference to the *Stramonium*."

Fruit.
170

SPECIAL OPINIONS REGARDING Datura Stramonium §.—"I have used the FRUIT as a poultice and anodyne in whitlow" (*Dr. Picachy, Civil Medical Officer, Purneah*). "A good anodyne application is made by preparing a warm infusion of the leaves, and this is effective in inflammatory pains; the crude juice of the leaves mixed with opium and rock salt makes a good local anodyne preparation when applied hot in rheumatism" (*Surgeon Edward S. Brander, M.B., F.R.C.S.E., I.M.D., Rungpore*). "The leaves, made into cigarettes, are smoked to relieve asthma. The smoke is inhaled into the lungs" (*E. G. Russell, Superintendent, Asylums, at Presidency General Hospital, Calcutta*).

For the European uses of the drug the reader is referred to works on *Materia Medica*.

CHEMISTRY.
171

Chemistry.—It has been stated that it is presumed that chemically the Indian forms of *datura* differ among themselves and from *Stramonium* more in degree than in quality. The active principle is the alkaloid *daturine*, a substance practically identical with *atropine*. The experiments of Schroff, however, would indicate that *atropine* has twice the poisonous energy of *daturine*, although the two alkaloids agree in composition, possess the same qualities in regard to solubility and fusing point, and have the same crystalline form. The identity of *daturine* with *atropine* has been maintained by several chemists, while the admission of the greater poisonous property of the latter is opposed to such an opinion. Ladenburg states that *D. Stramonium* contains two alkaloids, which he designates as heavy and light *daturine*. Pochl affirms that solutions of *daturine* are levogyrate, while those of *atropine* exhibit no rotatory power. It is probable that the light *daturine* if isolated would bear a much closer approximation to *atropine* than the mixture of the two.

The leaves contain the alkaloid in a much smaller proportion than the seeds, and even the latter possess only $\frac{1}{10}$ th per cent. In the seeds it is said to be combined with malic acid. According to Joubert *datura* for ophthalmic purposes is more powerful and lasting than *atropia*.

§ Dr. Warden (Professor of Chemistry, Calcutta) has kindly furnished the following note regarding the chemistry of *datura*:—"The alkaloids, *atropia* and *datura*, contained, respectively, in *Atropa Belladonna*, and *Datura Stramonium*, are either identical or agree very closely in chemical

* "In the *Asiatic Researches*, VI., 351, Colonel Hardwicke enumerates the *Datura Stramonium* among the plants which he found in the *Sirinagur* country; but he afterwards ascertained that the plant which he met with was the *Datura Metel*; and has candidly authorised me to notice the mistake" (*Foot-note by Dr. Fleming*).

Habitat.—According to the *Flora of British India* the Carrot is a native of Kashmir and the Western Himalaya, at altitudes of from 5,000 to 9,000 feet. Stewart says its range in Kashmir is from 3,200 to 5,000 feet, and Adams alludes to the bear as feeding on the carrot and strawberry root. Dr. Johnstone has, in his herbarium of Simla plants, a specimen collected on Murale hill which has large fleshy roots. Of this he remarks that it is a favourite food with bears.

Throughout India the carrot is cultivated, by the Europeans, mostly from annually imported seed, and by the natives, from an acclimatised if not an indigenous stock. In many parts of the country a greenish white carrot is preferred as being very hardy and productive. This rises some two or three inches above the soil, is a coarse root which possesses little of the flavour of the European carrot, but it is able to withstand the extreme heat of summer, and may be raised in some parts of the country throughout the year. It thus produces a return at seasons when other tubers or roots are scarce or not available. This is particularly the case in Behar (Patna) and some parts of the North-West Provinces. Sir Edward Buck, while Director of Agriculture in these Provinces (1878), wrote a long and interesting note on carrot cultivation as a means of human food in periods of threatened scarcity or famine. The arguments then advanced have given to the subject of carrot cultivation in India an interest which, as an ordinary garden crop, it did not previously possess. The present account deals, therefore, more fully with the subject than most persons acquainted with Indian agriculture might be prepared to expect, and it is hoped, should necessity ever arise for strenuous efforts being made to produce food, that a compilation like the present, from all existing sources of Indian information, may prove useful.

The Carrot	(G Watt)	DAUCUS Carota.
		HISTORY. 174

prove that abundant nutriment produces a definite and inheritable effect on the so-called roots, with scarcely any change in other parts of the plant." Conversely, neglect or the consequences on a succulently developed plant running wild would naturally be to reduce the edible property until in time it might ultimately disappear. This retrogression is,

Kashmir he found that the people eat the wild carrot, a circumstance confirmed in a measure by the observation that bears eat it. Indeed, it seems highly improbable from the simple examination of the wild carrot as met with in Europe, that the idea could ever have occurred of cultivating it, in the hope of producing an esculent root. Aitchison found the carrot wild in the Kuram valley, but of the Hari rud (Afghanistan) he says the *sardak* is not indigenous but a weed and an escape from cultivation, in cultivated land, also that the carrot is very extensively cultivated both in Afghanistan and in Persia. According to most writers the *daucos* of Theophrastus was the carrot, and from that word the generic

Daucus Carota. At the same time it is known that the Greeks actually cultivated the Carrot - and most times the object was to increase the extent from a
from a

The Greeks often talked about *κεραρα ποτιν τιρι* and the individual so favoured was a *χερασθοπος* carrots and horns are, in fact, closely associated. The Greeks called the plant Phileon, because of its supposed connec-

DUACUS
Carota

The Carrot.

HISTORY.

tion with amatory affairs. The word *Daukon* was given to an umbelliferous plant, but not necessarily the carrot, though generally accepted as such. *Carota*, the Latin name, was perhaps derived from *caro*, flesh, and *carota* is mentioned by Apicius, the celebrated author on cookery (A. D. 230). Some writers, however, say that it is derived from *car*, the Celtic for red. This seems highly improbable, as it is doubtful if the Celtic race cultivated any vegetable so far back as the date given above for *Carota*, from which Carrot is doubtless derived. The Persian names for the root are *Zardak* and *Gazar*, its Sanskrit *Garjara*, and its Arabic *ʿaggar*, words in all likelihood obtained from one source, and that probably the Sanskrit. Persian scholars, at all events, accept *Gazar* as a simple Sanskrit word, and not a derived one, but the modern *Zardak* is said to come from *zar*, golden, or *zard*, yellow. The resemblance of the Kashmir name *Mor mûj* to some of the European names, notably the Russian *Morkov*, is remarkable.

Carrots appear to have been regularly used in India in the time of Akbar (corresponding to the period of Queen Elizabeth in England). They are alluded to among the vegetables and pickles used by the Emperor, but there occurs also the word *Shagâgul*, which both Gladwin and Blochmann have translated "wild carrots," though, as already shown, this translation is most probably incorrect. While much reliance cannot be put on names of plants, as historic evidences, it is significant that throughout the languages of India, indeed, from Central Asia to Cape Comorin, there should prevail in every language a name for the carrot which seems to have come from a common source. To that name is frequently added a further word meaning "root" or "tuber." Thus, in Tamil, it is the *Gajjara-kelangu*, the *Kartu-kizhangî*. Whether or not we view *Kartu* as an approximation to the European derivatives *Carota*, *Carrot*, &c., the further explanatory word simply means tuber or bulb. In this connection it may be added that Ainslie, who wrote of Madras at the beginning of the present century, gives the Tamil for Carrot as *Cârrot-kûlung*. The Telegu language, among many other names for the carrot, has the following: *Gajjara-gedda*, *pita-kanda*, and *shikhâ-mulam*. Here, again, the terminal words *gedda* (or rather *gadda*) and *mulamu* (the Sanskrit *mulam*) simply mean root or rhizome, and are the equivalents of *jar* in Hindustani, *vêr* in Tamil, and *vêru* in Telegu. The derivation of the Latin name *Carota* mentioned above, as is customary with writers on this subject, has been given as *caro*, flesh, but the evidence of cultivation would almost lead to the inference that the carrot spread from Central Asia to Europe, and if so it might be possible to trace from the Indian, Sanskrit, and Persian names those of Europe. Ainslie has no hesitation in affirming that India obtained the carrot from Persia, but in the *Ain-i-Akbari* Abul Fazl makes no mention of carrot as having been introduced. While he goes into details regarding many of Akbar's fruits and vegetables, specially mentioning those, such as the pine-apple, which were less known, he treats carrots as a matter of course. The Muhammadan invaders of India were perhaps, for centuries before Akbar's time, equally familiar with the *Garjara*, *Gazar*, *Gajir*, *Zardak*, the golden root, and thus, as a regular vegetable, it was grown and eaten in India when in Europe it was scarcely known as more than a wild plant. As a somewhat curious historic fact it may in conclusion be stated that in the reign of James the First ladies adorned their head-dresses with carrot leaves, the plant having begun to be cultivated in England during Queen Elizabeth's time. It was largely grown in many parts of the Continent of Europe some time before it found its way to England. Belgium and Holland may especially be mentioned, since in these countries, even at

The Carrot.	(G Watt)	DAUCUS Carota.
the present time, it is a recognised field crop, whereas in England as a whole it has not left the domain of garden production.		CULTIVATION. 175

CULTIVATION.

Panjab.
180

a garden crop. In the *Bengal Gazetteers* and other publications mention is also made of carrots. In Rungpore, for example, they are said to be sown in October and November, the crop being gathered in March and April, but in Patna they are said to be sown in July and harvested in December and January. Of the *Panjab* brief notices are made of carrot cultivation. In Jhang, for example, it is said that "the zamindar's food consists largely of carrots" (*Replies to the Famine Commission*, page 228). In Sialkot carrots "are grown all over the district, but the superior kinds of English carrots are little known or appreciated." In Hazara the carrot is sown in September and October and gathered in December and January.

N.-W. P.
and Oudh.
181

The N.-W. Provinces and Oudh.—It has been estimated that there are 30,962 acres under carrots in these provinces, 2,557 acres being dry land and the remainder irrigated. In Oudh 35,721 acres, of which 3,599 are on dry land. Similar figures for the other provinces of India are not available; but as the carrot is very nearly cultivated to the same extent in most provinces an approximate idea of the total area under carrots may be assumed. In the N.-W. P. Agricultural Farm Report (1884-85, page 17) useful information is given regarding experiments made in the cultivation of European and the so-called indigenous carrot. The following results were obtained:—

	Outturn per acre in maunds.	Manure.	Ploughings.	Weedings.	Waterings.
Belgian Carrots—					
On ridges . . .	153·5	Poudrette 250 maunds per acre.	5	6	7
On lines . . .	113·8				
Country Carrots—					
On ridges . . .	355·3				
On lines . . .	315·5				

The country thus gave at least double the return of the imported. The seed was sown in September and October, and the crop obtained in November and December. Of Meerut it is said that carrot cultivation is becoming more general. In 1870 there were 250 acres, and in the replies to the Famine Commission it was contended that carrots were "most useful under failure of *kharif*."

Assam.
182
Burma.
183
Madras.
184

Of *Assam*, *Burma*, and *Madras* little can be learned regarding carrot cultivation, and it seems probable that, in these provinces, the root is only raised as a garden vegetable. Of *Burma* the Director of Land Records and Agriculture reports:—"It is planted at the beginning and reaped at the end of the rainy season. The soil required for its cultivation is a porous, moist, sandy one." It is only grown in *Burma* to a small extent.

FAMINE
CROP.
185

ARGUMENTS REGARDING CARROT CULTIVATION AS AN EMERGENT CROP AT SEASONS OF THREATENED SCARCITY OR FAMINE.—The following may be given as a brief abstract of the leading facts and arguments advanced in Sir E. C. Buck's report on this subject, to which reference has been made above:—"In the half-yearly agricultural report in the N.-W. Provinces, published in the local Gazette of September last, I adverted to the extension of carrot cultivation which had taken place in consequence of the failure of the *kharif* in 1877." The replies received from enquiries instituted all over these provinces "corroborate the ideas which had been formed of the reliance placed by the agricultural population upon carrots, and to a less extent upon radishes, under failure of the ordi-

cial stocks might be carried on alongside of continuous efforts to acclimatise European seed of good quality. Sir Edward Buck's farther remarks regarding the discovery of what parts of the south of Europe could afford seed suitable to India might also receive consideration, for it is clearly a desirable feature of a subject, like that of extended carrot cultivation, to know the producers to whom application should be made for seed, and this can only be learned after extensive comparative tests have been carried out.

OIL.
Seed.
186

Oil.—Carrot SEED yields a medicinal oil; this is obtained by distillation. It is a pale-yellow volatile oil and may be said to be the chief property of the seeds. It has a strong penetrating odour and a warm and somewhat unpleasant taste.

MEDICINE.
Seeds.
187
Leaves.
188
Roots.
189

Medicine.—The carrot is not official in the English nor Indian Pharmacopœias, but by the natives the SEEDS are considered a nervine tonic. Boiled with honey and fermented, they produce a spirituous liquor. A decoction of the LEAVES and seeds is said to be used as a stimulant to the uterus during parturition. The ROOTS are made into a marmalade which is considered refrigerant. Dr. Dymock writes that "in the Concan a poultice of carrots and salt is used in tetter, and the seeds are eaten as an aphrodisiac." Formerly the carrot seeds (fruits) were used in European medical practice, and they are so still in America. They possess aromatic, stimulant, and carminative properties, and were used in diseases of the kidney, flatulent colic, dropsy, &c. A poultice made of the roots is even at the present day resorted to, in domestic medicine, to correct the discharge from ill-conditioned sores. The raw rasped root is also deemed useful as a stimulating application, and is made into an ointment with lard. This is used in burns and scalds to good effect. Pickled-carrots are much lauded by Persian writers as a cure for spleen. In the *American Dispensatory* it is stated that the wild root may be substituted for the seeds. It is whitish, hard, branched, and possesses a disagreeable smell.

Pickled.
190

SPECIAL OPINIONS.—§ "The crushed roots form the vehicle for many medicines used by native Hakims, and have the reputation of having tonic properties" (*Narain Misser, Kothe Bazar Dispensary, Hoshangabad, Central Provinces*). "The raw carrot when eaten acts as a mechanical anthelmintic" (*Surgeon Major D. R. Thomson, M.D., C.I.E., Surgeon, 1st District, Madras*). "Poultice of the root is useful in chronic and fetid ulcers" (*Surgeon Major George Cumberland Ross, Delhi*). "Boiled and given to cattle with the view of making them fat" (*Assistant Surgeon Annund Chunder Mookerji, Noakhally*). "The seeds are used to bring about abortion. The roots are used as poultice" (*Surgeon Major Robb, Civil Surgeon, Ahmedabad*). "Used in dysentery and enlargement of spleen" (*John McConaghy, M.D., Civil Surgeon, Shahjahanpore*).

CHEMISTRY.
191

Chemistry of the Carrot.—"The constituents of the root are crystallisable and uncrystallisable sugar, a little starch, extractive, gluten, albumen, volatile oil, vegetable jelly or *pectin*, malic acid, saline matters, lignin, and a peculiar crystallisable, ruby-red, neutral principle, without odour or taste, called *carotin*. This latter principle has been well studied by Husemann, who gives it the formula $C_{18}H_{24}O$. Husemann has also described a colourless compound, *hydrocarotin* $C_{18}H_{30}O$, which exists with *carotin* in the juice of the carrot, and is probably changed into the latter by oxidation as the plant develops in growth." "The substance called *vegetable jelly* was by some considered a modification of gum or mucilage, combined with a vegetable acid. Braconout found it to be a peculiar principle, and named it *pectin* from the Greek *πηκτις* expressive of its characteristic property of gelatinising. It exists more or less in all vegetables, and is

Coffee is often largely adulterated with carrots, and the reputed use of carrots as an adulterant in marmalade, doubtless rests on the presence of the vegetable jelly referred to above under the paragraph—"Chemistry of the Carrot."

Domestic Uses.—The peduncles and flower-stalks are used by the hill-tribes as tooth-sticks.

Davallia, *Smith*; *Hooker and Baker, Synopsis Filicum*, 88; *Beddome, Ferns, British India and Ceylon*, p. 58.

A genus of handsome ferns named in honour of the Swiss botanist Davall, the chief characters of which are the creeping rhizome and the involucre impressed in the substance of the margin of the frond so as to form an urceolate cyst like a miniature capsule. The economic history of Ferns is extremely imperfect. The above brief notice has been thought desirable so as to assign a place and number in the present work for one of the most extensive and most elegant of the genera, in the hope that with the advance of knowledge, we may be able to mention the uses to which some of the species are put.

Habitat.—A large shrub of the western temperate Himálayas, from Kashmir and the Salt range to Kumaon, altitude 3,000 to 5,000 feet. Distributed to Afghánistán and Abyssinia.

FIBRE.
197

Fibre.—All the species of *Debregeasia* afford strong and useful fibres, which are more or less extracted by the hill tribes and used for ropes and cordage. Our knowledge of these fibres is, however, too imperfect to allow of separate accounts being given, in which the comparative merits of the fibres from the various species would be discussed. It has, therefore, been thought desirable to draw up in one place a brief review of all the opinions which have been published regarding these fibres, but it must be added that, should hopes ever be entertained of the utilisation, commercially, of *Debregeasia* fibre, the first step would naturally be to have the individual properties of the species thoroughly investigated. In general terms it may be said that writers on Panjáb products, who refer to a *Debregeasia* fibre, are speaking of *D. hypoleuca*; descriptions dealing with the Central Himálayas (e.g., Kumaon, Garhwal, and Nepal) refer to *D. hypoleuca* and *D. velutina*; of the Eastern Himálayas (e.g., Sikkim, Assam, and Burma

DEER.

The Spotted Deer.

ard that would be found to correspond with the arrangement adopted in the classification of the animals in purely Zoological Museums.

It is not intended, in this work, to deal with sport, but it may be worth mentioning (in connection with the subject of domestication) that in the *Ain-i-Akbari* an interesting account will be found of the fighting-deer kept by the Emperor, also of the sport of hunting for these animals by means of snares attached to trained deer. It is stated that "His Majesties had 12,000 deer" kept for these purposes.

The following paragraphs will be found to contain the vernacular names of the commoner species, their habitat and other peculiarities; but for further particulars regarding the Economic Products derived from the animals, the reader is referred to the following subject-headings:—"Hides and Skins," "Leather," "Horns, Antlers, and Ivory." For the Bovine animals to "Oxen," and to "Sheep and Goats."

Axis maculatus (Jerdon, *Mam.* 260).

212

THE SPOTTED DEER.

Vern.—*Chital*, *chitra* (*chitrī-jhīnā*, male), HIND.; *Eora-chitāya* (PUNJAB), *chaitān* (BHAGLEPORE), *churiya* (GOAHARPORE, BENG.), *Sirang* (BELGACH), *Folli-mazun*, TAM.; *Dagā*, TEL.; *Lupā*, GOND.; *Sargā*, *jān mīkka*, KAN.; *Zubāi*, ARAB.; *Gousun*, PERS.

Habitat.—Throughout the greater part of India, except the Panjāb, but apparently not found east of the Bay of Bengal. It is met with abundantly on the lower and outer slopes of the Himalāya, and immense herds may be seen in the Sunderbuns. It frequents forests bordering on streams, and is gregarious, very often occurring in herds of 50 to 100 or even 100. The most elegant and graceful of Indian deer, it is said to be found only in fascinating bits of country, its dappled hide being seen to sparkle in sunlight, of the mixed bamboo glades, as it bounds from the intruder or the slightest indication of danger.

See an interesting account of this deer in the Kanara Gazetteer, page 101. It is there stated to be rapidly being exterminated.

Skins.
213
Antlers.
214

SKIN AND ANTLERS.—The skin, a yellowish or rufous fawn, spotted with white, is much admired for ornamental purposes. The antlers have the three-times longer than the royals or posterior tines. They are shed in February and March, and are commercially in considerable demand, but actual statistics cannot be obtained. Liverpool is said to have imported from 1851—55, 20,000 of these antlers, and during the same period 700 of the skins. The following note, furnished by Major A. E. Ward, will be read with interest:—"There is a considerable trade in the horns as well as in the skins of the spotted deer. Formerly, in the times when this deer was plentiful, some of the Cawnpore leather firms gave contracts to men who supplied *shikāris* with powder and ball, and thus ruined the shooting in many parts of the Terai and the Duns. One firm gave a wholesale price of Rs 50 per hundred skins; and at this rate attracted many offers of sale. The flesh is exchanged by the hunters for flour, &c. The tanned leather does not wear well."

"The spotted deer is very irregular in its breeding habits. It accordingly sheds its horns at no absolutely fixed period. The horns may thus be seen to be in velvet on some individuals and quite hard in others at almost any season of the year."

FOOD.
215

Food.—The flesh "is very good eating in the cold weather months." Ainslie (*Mat. Ind.*, I., 110) says, "as venison it is not worth much, unless when caught young and fed properly." In Kanara an animal on account of its flesh is said to sell for Rs 5-8.

D. 215

The Hog and Rib-faced Deer; the Sikkim Stag.

(G Watt)

DEER.

Axis porcinus (Jerdon, *Mam*, 262)

THE HOG-DEER.

Vern.—*Para*, HIND, *Nuthris karan* BENG, *Khar laguna*, NEPAL TARAI, but *Sugoria* is also sometimes given to it

Habitat.—Throughout India, though less frequent in the central parts, abundant in Assam, Burma, and Ceylon. It is seldom found in forest land, preferring open grassy jungle. It lies all day in sheltered thick parts and only rises when run upon by the sportsman or his beaters. It gets its name of Hog-deer on account of its awkward gait. Major Ward writes that it leaves the thickets for "swampy ground directly the hot weather comes on, and may often be found in snipe wheels in the cold weather."

Skin and Antlers.—According to the same authority the skin of this species is not in much demand.

Food.—The meat is said to be fair by some writers, but Major Ward is of opinion that it cannot be recommended. His words are "This deer suffers greatly from internal parasites. And although the flesh is at times fairly good, what between these intestine parasites and the fact that the skin is often pierced by the grub of the *Bot*, I think the meat cannot be recommended."

216

Habitat.—India, Burma, Ceylon, the Malay Peninsula, Sumatra, Java, Borneo, &c. Sportsmen describe this as a retiring little forest animal, generally found alone or at times in pairs, "creeping," as Hodgson remarks, through the tangled jungle or under fallen trees. It is said in Kanara to love the dense shade of the *Karvi* (*Strobilanthus*) that covers Sahyadri slopes (*Kanara Gazetteer*, page 102).

Skin and Antlers.—Major Ward says that "the skin of the barking deer is very largely in demand, as it is very tough when tanned. Shoes and leather socks are made in great numbers from it. Saharanpur, Meerut, and Dehra *mochees* are the principal dealers in this hide." "The horns are too small to be of value."

Food.—"It is excellent venison, but rarely carries any fat." This statement is confirmed in the *Gazetteer of Ratnagiri*, but the venison is said to be all the more appreciated in a district where mutton is scarcely attainable.

225

Cervus Wallichii (Jerdon, *Mam.*, 250).

THE KASHMIR STAG.

Vern.—*Barasingha*, HIND.; *Fangul* or *Honglu*, KASHMIR.

Habitat.—Kashmir, the Sind valley, to Budrawar and Kishtar eastward, inhabiting pine forests at altitudes of 9,000 to 12,000 feet, descending to lower levels in autumn and winter. The larger stags, Major Ward writes, seldom come below 7,000 feet. "In the spring this animal migrates from the valleys of Kashmir and wanders far, often crossing the lower passes, *vis.*, the Mingan, the Togila, &c. It clings, however, to country that is fairly wooded. It is rapidly decreasing in number."

Antlers.

226

Antlers.—"The horns form a portion of the tribute paid by the shikáris to the Máharája of Jammu. The best are sold at high prices from R15 to R30 per pair, and are bought by taxidermists and collectors of horns."

227

Moschus moschiferus (Jerdon, *Mam.*, 266).

THE MUSK DEER.

Vern.—*Kastura*, HIND.; *Rous*, *rús*, *kasturá*, KASHMIR; *La-lawá*, TIBET; *Rib-jo*, LADAK; *Bena*, KANAWAR; *Mussuck-naba*, PAHARI.

Habitat.—Found throughout the Himálaya at elevations above 8,000 feet: distributed to Central and Northern Asia and Siberia. The musk deer is a forest-loving animal, keeping much to one locality. It is wonderfully sure-footed and is able to leap and bound over the steepest and most broken ground. Colonel Markham (*Jour. Sporting Adventures and Travel in Chinese Tartary and Thibet*) says: "On a gentle slope I have seen them clear a space of more than sixty feet at a single bound, for several successive leaps, and spring over bushes of considerable height at the same time." It is an exceedingly shy animal of nocturnal habit, and not much larger than a greyhound. Of all ruminants it is reported to eat the least, and although no connection can be traced between the nature of the food it eats and the production of musk, it is a common opinion among traders that those reared in forest-clad countries are better than those met with in open rocky regions. It is said to eat the tangled grey lichen (*Usnea*) that hangs from trees everywhere on the higher Himálaya, and the leaves of various shrubs, as also grasses, roots, &c. Colonel Markham alludes to a popular opinion that it eats the leaves of a laurel (*kedar pattu*), probably *Litsæa umbrosa*, a small tree or bush frequent up to about 7,000 feet, but certainly not common at the altitudes where the musk-deer lives. Major Ward, however, repudiates this statement, characterising it as a native absurdity.

DESCRIPTION

229

Description.—"The musk is milky for the first year or two, afterwards granular; the dung of the males smells of musk, but the body does not, and the females do not in the slightest degree." "The musk-deer is

D. 229

Musk and the Musk Deer.	(G Watt.)	DEER.
<p>much sought after for its musk, many being shot and snared annually — rupees The musk as sold &c One ounce is about the tomical details of interest (by Dr Campden) may be here given — the musk bag lies at the end of</p>		DESCRIPTION.

best both in appearance and smell if the pod is at once cut from the skin, and allowed to dry of itself" Mr. F. Peak (of Peak Allen & Co) wrote to Mr. — — — — — that "The hairy bladder, like skin gets both

the hairy-skin was declared to be far superior" Referring to the process of drying skin around the pods he adds "By the continued heat much of its odour is driven off, and it is consequently deprived of its qualities as a remedial agent, and for the use of the perfumer is greatly deteriorated" (See also Peak P. & Tr, Feb 1861)

Adulteration — The extent to which musk adulteration has been carried seems natural enough, especially at the present time, when nearly every commercial article is counterfeited to some extent The high price paid for the perfume, the uncertainty of the supply, and the difficulty of detection must have all naturally tended to suggest a certain amount of adulteration

ADULTERATION.
230

real pods, and its place supplied by some other substance, and these are difficult to detect even if cut open, as whatever is put in is made to resem-

ADULTER-
ATION.

ble musk in appearance, and a little genuine added makes it smell nearly as strong. Some have only a portion of the musk taken out, and its place thus supplied; and others have all the musk left in, but something added to increase the weight." The above description of the process and materials of adulteration differs but little from that written in 1596 by John Huygen van Linschoten. That early traveller was misinformed when he stated that the true musk was the testicles of the animal, and this mistake his contemporary, Dr. Paludanus, corrected. He wrote: "Some are of opinion that muske groweth at certaine times of the yeare about the navell." But Linschoten's account of the Chinese adulteration of the article, traded in by the Portuguese at so early a date, is worth quoting in this place. He says that having killed the animals "they let them lie and rot, blood and flesh together: which done they cut them in pieces both skinn, flesh and blood, all mixed together, and thereof make divers purses, which they sow (in a round forme) and are in that sort carried abroad and sold. These purses are commonly of an ounce waight the peece. and by the *Portingales* are called *Papos*, but the right *Papos* and perfect *Mosseliat* is the bullockes or stones of the beast, the others, although they passe among them for *Mosseliat*, are not so good as the stones: therefore the Chinaes (Chinese) who in all thinges are very subtil, make the purses cleane round, like the stones of the beaste, therewith to deceive the people, and so the sooner to procure them to buy it." So again he says: The Chinaes are very deceitful in selling of *Mosseliat* (or Muske), for they folsife it verie much, sometimes with oxen and cowe's livers, dried and beaten to powder, and so mixed with the *Mosseliat*, as it is dayly found by experience in searching of it."

Commercial Forms of Musk.—Piesse says there are three kinds, *vis.*—

"The *Cabardien*, or Russian Musk, which is rarely, if ever, adulterated; from its poorer fragrance, however, it does not fetch more than 8s. an ounce in the pod. The *Assam Musk* is next in quality: it is very strong, but has a rank smell: the pods are very large and irregular in shape: it fetches about 24s. per ounce in the pod. The *Tonquin* or Chinese Musk yields the kind mostly prized in England, and is more adulterated than the former; market price from 26s. to 32s. per ounce in the pod." Further on Mr. Piesse again refers to the Assam Musk:—"The musk of Assam and South Thibet reaches Europe by way of Calcutta. It is sent in bags enclosed in a chest of wood or tin-plate, which holds about two hundred pods. The form of this musk is more valuable than that of the Nankin musk." Although Mr. Piesse publishes extracts from his correspondence with Peak, Allen and Co. regarding Himálayan musk, he does not (*in his Art of Perfumery*) furnish any information as to the comparative value of Himálayan and Assam. Dr. U. C. Dutt says that, according to Sanskrit literature, there are three kinds of musk—"The *Bhāvatprākāśa* describes three varieties of musk, namely, *Kāmrūpa*, *Nepāla*, and *Kāshmīra* musk. *Kāmrūpa* musk is said to be of black colour and superior to the others. It is probably China or Thibet musk brought to India *via* Kamroop in Assam. *Nepāla* musk is described as of a blueish colour and intermediate quality. *Kāshmīra* is of inferior quality."

The following note, regarding Panjāb musk, has been obligingly placed at the writer's disposal by G. G. Miniken, Esq., Deputy Conservator of Forests:—

"In Bashahr on the Sutlej and on the Rupin and Paber rivers, the Musk-deer was at one time plentiful, but it is generally stated that it is not now so numerous.

"The right of hunting the musk-deer belongs to the Rajah, and he employs trained shikāris to hunt them; but this right is in truth not respected.

to Rampur

Indian Trade in Musk—The extent of the internal trade in musk cannot be discovered, but as the animal is systematically hunted all over the region where it occurs, and the so-called musk-pods are to be had in every drug-seller's shop, the consumption must be very extensive.

Mr. Baden Powell says that "about 100 musk-bags are imported

TRADE.

would fall short of the actual mark, since a small expensive article like that of musk must be extensively trafficked in outside the limits of possible commercial statistics. Calcutta is, however, the chief emporium of the trade, and some conception of its total extent may be gathered from the figures of Foreign Exports by Sea from India, which, it may be repeated, represent the surplus over and above Indian consumption. Last year (1887-88) India exported 2,144 ounces valued at R72,116, and of that amount only R20 worth left Bombay, the rest being exported from Bengal, and R61,226 worth were consigned to the United Kingdom. The exports in 1886-87 were valued at R70,913, the smallest amount since 1878-79. The average exports for the past ten years may be taken to have been valued at R1,11,750. The total amount of musk exported from India during these years was 44,195 ounces, valued at R11,17,519. Each animal contains only one musk-pod, the average weight of which is about one ounce of musk, so that the above figures would represent an annual slaughter of about 4,500 male animals to obtain the musk exported from India. These are of course not all killed within British territory, the traders bring a large proportion from the regions on the north of the Himálayas. But on the other hand the internal or Indian consumption is not estimated for, so that it is probable the Indian trade (internal and exported) represents a slaughter of little short of 10,000 musk-deer annually. And doubtless a large number of females are caught in the snares by which the natives capture the animal, so that it is probable that nearly 20,000 are actually killed by the traders and sportsmen combined. This wholesale extermination doubtless has something to say to the visible decline in the supply and to the decrease in the exports, but it is also probable that other animal and even vegetable sources of supply are yearly coming into greater importance.

The value of the musk-pod is said to average from R10 to R15. For further particulars, in continuation with this account of the Perfume musk, see Musk in another volume, in which will be found the medicinal and chemical properties of the substance and its applications in the art of perfumery, together with information regarding the other sources of supply.

Skin.—The skin of the musk-deer does not appear to be of any value. It is covered with rigid porcupine-like hairs.

Food.—The flesh of the young animal is reported to be tender and well flavoured. The female does not produce musk, but even, in the male, while the animal smells strongly and the dung also is musk-scented, the flesh is perfectly devoid of the odour, not even the stomach, nor the contents of the stomach, removed after death, partake of the characteristic smell.

DELPHINIUM
Brunonianum.

The Larkspurs.

DELPHINIUM, Linn.; Gen. Pl., I., 9, 953.

A genus of annual or perennial herbs, containing some 40 species, which are distributed throughout the north temperate zone and on the temperate tracts of lofty mountains in the southern zone. The generic name, derived from the Greek *Delphinion*, arose from the somewhat fanciful resemblance of the flower-bud to the head of the Dolphin, and the English name Larkspur was doubtless occasioned through the long spur-like prolongation at the base of the flower. The common Larkspur, *Delphinium Ajacis*, takes its specific botanical name from the supposition of its petals denoting the letters, A. I. A., the initials of Ajax, the Greek Trojan hero. The Larkspur is a favourite garden annual in India. On the Himálaya it shows a distinct desire to leave the restricting influence of cultivation, and even in some parts of the plains manifests a tendency to become perennial. Withstanding the intense summer's heat of the drier areas, it may sometimes be seen to flower during winter and spring for several successive seasons. In such cases, however, it assumes a rigid bushy habit, and has small pale-coloured flowers. In fact, it alters its faces so far as to largely lose its accepted specific characteristics, and assumes some of those of *D. orientale*. Firminger remarks that he had "failed completely to germinate imported Larkspur seed in the plains of India." The plant must be first acclimatised in the temperate regions of India, and be brought gradually down to the plains. The stock found in the plains consists of *D. Ajacis* and *D. consolida*. The latter having larger flowers on longer peduncles and the segments of the leaves broader than the former. Firminger speaks of both collectively as "a poor weedy worthless thing." In a further passage he concludes:—"If the ground where Larkspurs have grown one season be left undisturbed, an abundant crop of self-sown plants will spring up the following November and December." In Bankipur (Behar), the writer carefully marked several individual plants and found that they continued to grow throughout the year, and even formed flowers during the hottest months, provided they were watered and had the partial shade from trees. In the same way a crop of lettuce was obtained at any season, and both Larkspur and lettuce produced from self-sowings the stock of seedlings for almost any month of the year. The Larkspur was thus acclimatised to one of India's dry hot tropical climates, and had practically lost its character as a temperate-loving plant. In most parts of India (preferentially the dry or non-inundated areas) it is practically a cold season garden weed, its single, faded, purplish flowers being unworthy of care and attention.

Habitat.—A very abundant plant on the higher Western Himálaya and Tibet, at altitudes of 13,000 to 17,000 feet.

MEDICINE.

Juice.
246
Leaves.
247

Medicine.—This plant is prized for its strong scent of musk. It is offered to the presiding idol of the hill temples. Aitchison, in his *Flora of the Kuram Valley*, remarks that the juice of the leaves of this plant are used in Kuram to destroy ticks in animals, but chiefly when they affect sheep. This is a curious fact, pointing to Stavesacre (*D. Staphisagria*, Linn.), which is now very largely used in Europe, and was employed both by the Greeks and Romans for a similar purpose, viz., the destruction of vermin.

SPECIAL OPINIONS.—§ "In Leh it is considered so poisonous that the dew from the leaves falling on grass is said to poison cattle and horses" (Surgeon-Major F. E. T. Aitchison, Simla).

poisonous properties. He described four forms—(1) *Singya bikh*, (2) *Bish* or *likh*, (3) *Bikhma*, and (4) *Nirbisi*. *Bikhma*, he explained, was a powerful bitter, and Wallich subsequently identified this as *Aconitum palmatum*. *Nirbisi*, Hamilton affirmed, to be devoid of poisonous property, while he announced *Singya* to be the root of a *Smilax*, and *Bish* or *Bikh* to be a virulent poison. More recent writers have extended the list of vernacular names given to the poisonous Aconites. Thus *Singyi* or *Singyi-bish* (the horny *lis*) and *mitha-rahar* (the sweet poison) are given to two forms of *Aconitum ferox*, the separate properties of which are recognised by the Indian drug-sellers. Both Hindu and Muhammadan writers on *Materia Medica* refer to many forms of poisonous and non-poisonous aconites. Some of the former are so poisonous as to have obtained the fabulous reputation of proving fatal to the touch. Of the latter many forms are mentioned, the names given expanding until they include an extensive series of tonic medicines, many of which are in no way related to *Aconitum*. In a like manner the word *Bish* or *Bikh* simply means poison, the *Visha* of Sanskrit; but it became specifically restricted as a proper name to Aconite, the most poisonous of all the poisons—*Bikh* or *Bis*, the poison. So also *Bikhma* or *Bishma* would mean “*bikh*-like,” and might be supposed to have been first applied to the less poisonous forms of Aconite, until, in the descending scale of transitions, the innocuous forms of Aconite were embraced by it, and in time also the root, or collection of roots, that ultimately received the designation of *Nirbisi*, with its synonyms in Arabic of *Jadwār* and *Mahferfin*, and in Persian of *Zadwār*. Whether or not the word *Nirbisi* means antidote, if a synonym for *Jadwār*, the root referred to must have been used as a drug to strengthen the system against poison—the alexipharmic of ancient writers. Royle wrote:—“The term *Nirbisi*, as observed by Mr. Colebrooke, implies that the drug is used as an antidote to poison, being composed of the privative preposition *nir* and *bis* poison; and in the *Makhsan-ul-Adwiya*, it is further explained as repelling from and purifying the body from poison.” Commenting on the above opinion held by Mir Muhammad Husain, Dr. Dymock says—“The Indian name *Nirbisi*, he (Mir Muhammad) explains incorrectly as *Nir*, the antidote to *Bish*, the poison. *Nirvisha* is a Sanskrit adjective meaning ‘not-poisonous,’ and *nirvisha* or *nirvishi* is never applied to Aconite by Hindu medicine writers, but denotes a peculiar sedge used as an antidote to certain poisons, viz., *Kyllingia monocephala*, Linn.” According to most writers the *Jadwār* possesses alexipharmic properties, and Dr. Moodeen Sheriff says—“*Jadwār* is the only safe word to use in ordering the non-poisonous aconites.” He, however, remarks, *Nirbisi* is often confounded with the Sanskrit name *nir-visha*, “and this is partly from the partial analogy that exists between their pronunciation, and partly from their literal and general meaning being nearly the same. *Free from* or *without poison* is the literal meaning of *Nir-vishani* or *Nir-visha*, and the meaning generally attached to it in books is an *antidote*. The only difference between the above meaning and the meaning of *Nirbisi* is, that the Sanskrit word *Visham* or *Visha* is the common name for any poison, whatever it may be, while *bis* in Hindustani is the name of a particular vegetable poison, viz., the root of *Aconitum ferox*.”

An antidote to Aconite poison would be a diffusible stimulant, and thus, as time went on, discovery after discovery would doubtless have expanded the list of drugs that might each deserve the name of *Nirbisi* or *Jadwār*. It may thus be safely assumed that every region and age had its favourite *Nirbisi*, and that special preparations of certain diffusible stimulants came to take the place of some particular root—the *Nirbisi* of the earlier authors. The writer had a sample of the sacred

DELPHINIUM
denudatum.

Costus root (the root of *Saussurea Lappa*) sent him from Assam as the
antidote, and the Aconite root from Nepal. The fact of con-

fore, be either carried from the one extremity of the Himalayas to the
other, passing from village to village and hand to hand over a wild
mountainous country of perhaps several thousand miles, or be imported
into the highland home of the savage Aka from the plains of India. But

that botanists have established the fact that, under *Aconitum ferox* and
A. Napellus—the most poisonous species of Aconite—there are forms
known to the shepherds of the higher Himalaya which, like *Aconitum*
heterophyllum, may be eaten with impunity, or used as tonic or anti-
periodic medicines. The *Makhsan-el Adwiyah* states that the only plant
that can grow near the *Bikk* in the *Jadwar*. This may be a mere
tradition, but if it be accepted as carrying any meaning with it, all idea
of the *Jadwar* being *Zedoary* would have to be completely set aside.
Dr. Moodeen Sheriff, indeed, urges that much unnecessary ambiguity
has been caused through an early error of regarding the word *Zedoary*
as derived from *jadwar* and *sadwar*. The Sanskrit scholar, the late
Mr. Colebrooke, identified *nirbisi*, *jadwar*, and *sadwar*, as synonymous
terms, and suggested that these were most probably given to a species
of *Curcuma*, but he added, if this be not so, they would have to be collec-
tively assigned to the root of some other plant. Ainslie contended that
the *nirbisi* of Dr. Hamilton "must not be confounded with the word
nirbisi, which is the Sanskrit for *Curcuma Zedoaria*." Dr. Dymock and
many other modern writers, however, assign these classical names to
Delphinium denudatum, not because of the roots of that plant agreeing
with the descriptions given by early authors, or of their being used (at
the present day) or known to possess the property of an antidote to
poison, but because the hill tribes, on a restricted portion of the Himalaya,
are stated to give it the local name of *Nirbisi*. The writer suggested to
Dr. Grimlette, Residency Surgeon, Nepal, the desirability of his institut-
ing certain enquiries into the subject of the Nepal Aconites. As the
result samples of a number of plants and roots, together with their verna-
cular names and notes as to uses, were communicated. The *Kala bikk*
of the Nepals, a less poisonous form of the same plant, known to the Bhotias as

datum, the Nils (N'wo) herb of the Nepales, and the Nirbisi of the Bhutias. Dr. Gimlette reported to be used by the *Drills* of Nepal for the same purposes as the *Sella* and *Pala* herbs. *Geranium collinum* (var. *Donianum*) was found to be the *Rafle* (red) herb of the Nepales, and the Nirbisi name of the Bhutias, and like the *Sella* herb was stated to be given as a tonic in dyspepsia, fevers, and asthma. Lastly, a plant, never before recorded as used medicinally, namely, *Caragana crassicaulis*, was sent to the writer under the name of *Artinus* of the Nepales and the *Artis* of the Bhutias; it was reported to afford a root employed as a sedative. The Nepales name, *Artinus*, may be admitted as recalling *Ahus* (*Aconitum heterophyllum*), and the Bhutia *Artis*, as bringing to mind *Kutli* (*Picrothiza Kurroa*), two drugs which, like the *Nils*-herb, (or *Nirbisi*) and the *Sella* or *Pala* herb, are employed as tonics and expectorants. (Cf. with *Coptis Teeta*, Vol. II., No. 1792, p. 522.)

Rathakish.
266

Delphinium denudatum inhabits the southern warmer slopes of the Himalaya, descending to lower levels than any of the acorites, though in its higher areas it becomes intermixed with *Aconitum heterophyllum*. Around Sela and extending into Kumbon and Kul'u, it is known as *mirbisi*, but it neither bears the name of *nirbisi*, nor has assigned to it any medicinal properties. It would not be difficult to suppose that if the original *nirbisi* or *nirbisi* (for the difference may alter) be the result of modern (special) error) was obtained from the Himalaya, and was also known as the *adaka*, it may have been some of the tonic and febrifugal roots already alluded to, but here, as *Moodeen Sheriff* thinks, the non-poisonous forms of acorite. The supposition would give meaning to Father Ansel's statement in the *Farther Pharmacopoeia*, published 1681) that the root, though poisonous when fresh, was perfectly innocuous when dried, and that when mixed with food and condiments it acted as a restorative. The *nirbisi* of the plants of India—the rhizomes of *Kyllingia monocephala*—may have come to be so called from their resemblance to Zedoary, the *Jadwar* of some writers. In pursuing such an opinion one might be almost pardoned the speculation that in the earlier ages of medical knowledge, the strength-giving bitter roots would have been likely to attract attention and to claim a high reputation long before the less evident, and more hypothetical, remedies of modern times became known. Since these tonics abound in the higher temperate regions of Asia, they would likely enough have continued, with the migrations of the people southwards, to be carried all over the fever-stricken plains that possess but few good tonic and febrifugal drugs. The property of an antidote to poison, if ever assigned to these drugs, might fairly well have depended upon their tonic action in strengthening the system against the effect of poison. The literature of *Nirbisi* is not so complete as that of *Jadwar*, but accepting the usual assumption as correct that these are mere synonyms, the present review of this subject may be concluded with a reference to the writings of Muhammadan physicians on *Jadwar*. Under that drug Mir Muhammad Hussein mentions *Antis* as its Arabic name, and *Sisyrysis* as its Greek. Dioscorides refers to two forms of the aphrodisiacal drug *coriaria*, but both these are most probably the saleep tubers which, in consequence of the superstitious doctrine of signatures, have for ages enjoyed in Asiatic countries the reputation of being stimulants to the generative organs. Muhammadan writers allude to saleep under the name of *Kang-wah-fhsan* (Foxes' testicles), and the odour of the fresh root is said to resemble that of semen. Saleep has in India the reputation of being a nervine restorative and aphrodisiac. Here then we have another link between the early *nirbisi* and the more recent Zedoary, which might serve to connect the rhizomes of the medicinal sedges *Kyllingia monocephala* and *Cyperus rotundus*. But

approaching the type of *D. Brunonianum* and *D. cashmirianum*. Has roundish leaves 5-9 lobed, and almost dentate instead of serrate. Flowers larger than those of the lower altitude, opening up more pronouncedly and pale blue coloured. This plant commences to appear where *D. denudatum* disappears, and ascends to the altitude where *D. cashmerianum* and *D. Brunonianum* occur.

Medicine.—On questioning hill people, who were found collecting *Jurinea macrocephala* (the roots of which are used as incense, under the name of *dhup*), and also the medicinal rhizomes of *Picrothiza Kurroa*, as to any uses of the roots of this *Delphinium*, the writer was informed that they were not collected, nor were they known to possess any medicinal virtues. The LEAVES were said, however, to be poisonous to goats. Neither the leaves nor flowers have the musk odour of *D. Brunonianum*. This negative information is alluded to here in consequence of the writer's conviction that authors who attribute medicinal properties to *D. denudatum* are most probably in error. If any *Delphinium* was a regular article of trade (medicinally) the present species might be expected to be so, far rather than the scarcer plant *D. denudatum*, which at most (though widely distributed at altitudes between 5,000 and 8,000 feet) occurs only here and there, and yields a small inert root.

271

Delphinium Zalil, Aitch. et Hemsl., *Botany of the Afghan Delimitation Commission*, published in the *Trans. Linn. Soc. (2nd series)*, Vol. III., 20, 30.

Vern.—Asbarg, HIND.; Asbarg (the dye), and *ghafis* (the medicine), PB.; Zalil, KHORASAN; Trayamán, gul-jalil, BOMB.; Asfrak, asperag, traya-mán, PERS.; Zarir, ARAB.

Habitat.—A perennial plant, throwing up a spike of bright yellow flowers two feet in height. Dr. Aitchison says of it: "This plant forms a great portion of the herbage of the rolling downs of the Badghis; in the vicinity of Gulran it was in great abundance, and when in blossom gave a wondrous golden hue to the pastures: in many localities in Khorasan, about 3,000 feet altitude, it is equally common." At another place he alludes to it again as with its showy blossoms covering the downs "which they illuminate with their brilliant colouring, affording a sight never to be forgotten."

DYE.

272

Dye.—The dried flowers and fragments of flowering stems are brought from Afghanistan to Multan and other Panjáb towns, from which they are conveyed all over India. In Multan, as in most other places, they are used along with *Akalbér* (*Datisca cannabina*) and alum, to dye silk a yellow colour. Sir E. O. Buck, in his *Dyes and Tans of the North-Western Provinces*, says of Asbarg: "A yellow dye extracted from the stalks and flowers of a species of *Delphinium*. "The flowers and stalks are imported into these provinces from Kabul and Khorasan via the Panjáb. A decoction made from them is much used in silk dyeing, giving the sulphur yellow colour known as *gandhaki*. It is also used in calico-printing. Its price is Rs 27.5 per cwt." This dye is also alluded to by Mr. Liotard, by Dr. McCann, and by Mr. Wardle, but under the name of *D. Ajacis*.

MEDICINE.

Flowers.

273

Medicine.—The FLOWERS are bitter, and are said to be used medicinally as a febrifuge. Dr. Dymock publishes the following early account of the drug, being a translation from the *Makhsan-el-Adwiya*: "*Zarir* grows in the Khorján hills, and is called *Asfrak* by the people of Shiráj, and *Arjikan* by the Greeks; the stem is about a span high, flowers yellow, like those of *Asfar-i-barri*, surrounded by a few soft prickles, leaves yellowish, small, root more than a span long. *Asfrak* is cold and dry, with slight

Food.—The young shoots are boiled and eaten in Sikkim, Bhutan, and Assam.

Structure of the Wood.—The halms are large, 3 to 6 inches diameter, rather hollow and not always straight, but they are used for every variety of purpose. The bamboo grows gregariously, on hill-sides, up to 3,000 feet, and the stems are 40 to 60 feet high. They frequently grow low and tangled, instead of straight; indeed, this bamboo may at times be recognised by this character and by the very thick shoots which grow out at the nodes (*Gamble*).

Mr. F. B. Manson, in an article in the *Indian Forester*, alludes to the utility of this bamboo to the tea planter in shading his estate from hot and violent winds. He then refers to the discussion as to its flowering. "I have noticed, he remarks, that the forest bamboo of the Terai is flowering pretty generally this year (1882); but the phenomenon does not universally affect all bamboos. I have also noticed clumps of this bamboo in a languishing condition which had lately flowered." Hooker, in his *Himalayan Journal*, says: "it flowers every year, which is not the case with all others of this genus; most of them flower profusely over large tracts of country once in a great many years and then die away."

284

Dendrocalamus Hookeri, Munro.

Vern.—*Ussey, assey, denga, ukotang*, Ass.

Reference.—*Brandis, For. Fl.*, 570.

Habitat.—An allied species to *D. Hamiltonii*, but with larger leaves (15 inches long and 3-4 inches broad), met with in the Eastern Himalayas, Assam, and the Khasia hills.

Structure of the Wood.—Stems 50 feet in height, and like the other species put to many useful purposes.

TIMBER.

285

286

D. longispathus, Kurz, For. Fl. Burm., II., 561.

Vern.—*Wa-ya*, BURM.

Habitat.—Frequent along the *chongs* in the moister upper mixed forests, and also in the tropical forests of Arracan, Pegu, and Martaban (*Kurs*).

Structure of the Wood.—Stems from 40 to 60 feet in height.

TIMBER.

Habitat.—Met with throughout India, but most abundantly in the plains and lower hills of Northern and Central India, ascending to 3,000 feet. Kurz says it is a xeroclimatic species, common on the Continent of India, but does not go further south than Upper Tenasserim. He describes it as a bushy plant, from 20 to 30 feet in height. Dr. King remarks that it is the only bamboo found on Mount Abu. It is scarce in Banda, but in the drier districts of Central and Southern India, it affects the cooler northerly and westerly slopes. In Bengal and along the foot of the Himalaya where the climate is damp, it occurs chiefly on the warm southerly faces of the hills. It has often deciduous leaves, and the stems, which frequently attain a height of 100 feet, are strong, elastic, and nearly solid.

CULTIVATION

CULTIVA-
TION.
Flowering.
293

FLOWERING, &c.—This species is sometimes said to flower gregariously, but more frequently single clumps are found to do so. Mr. Gamble publishes an account of its flowering along the base of the hills in the North-West Provinces. Mr. Greig (the Conservator) reported: "I have observed numbers with one or two stems of a clump in flower, in some places as many as 5 per others I have only four thousands examined. In over large areas have thicket of young clumps or from 10 to 30 feet high. The seeding com-

ever since." Whole
 and died in 1877-

FLOWERING.

gradually spreading westward among the southern face of the Siwaliks. It remains to be seen whether this gradual march will continue along the rich bamboo forests of the eastern and central ranges of the Saharanpur division. Elsewhere I have seen this species flowering only sporadically." *The Seeding of Bamboos*, by A. F. Brown, Esq., published in the *Ind. For.*, Vol. XII., p. 413.)

A long and interesting "Note" on the cultivation of this species in the Central Provinces will be found in the *Indian Forester*. But the following brief passages may be here republished:—"In every forest producing this species, a certain number of stems flower and seed annually, but a general seeding is only an occasional occurrence. Regarding the time or conditions of seeding, nothing definite is at present known, but it is evident that general seedings are associated with a short rainfall. In general seedings all clumps of the same age appear to seed within the two years over which the seeding generally seems to extend. It is the opinion of natives, and one which is believed in by many forest officers and others, that seeding is prevented or retarded by heavy working of the clumps; the opinion is doubtless to a certain extent correct, but it is improbable that cutting will have effect if deferred till the clumps begin to flower. It is not an uncommon thing to find small one-year old shoots from clumps entirely cut over, producing seed." "It has been observed that a poor and unfavourable soil is conducive to the production of seed." "Probably the real cause of seeding is exhaustion of the soil accessible to the roots of the clumps, which is felt the more the dryer the season: a supposition further supported by the fact that seeding is more common on poor than on rich soils. Stems that flower casually yield hardly any fertile seed, and hardly any seed at all, whereas in the general seedings the yield is very large and of excellent quality, especially in the first year" (*Ind., Forester*, IX., 531).

Speaking of the shedding of the leaves, Mr. Kurz remarks that it "becomes often evergreen in damper climates, or when grown in moister localities." With reference to the flowering, he remarks that this occurs when the plant is between 25-30 years old. A man who has seen two flowerings is considered old. It is generally followed by the death of the clump, but "exceptional cases are known to me where a shoot was thrown up and grew and formed a new stock." He states that the seedlings grow from 1 to 1½ feet in height during the first year and not more than 4 feet up to the third. Brandis says "the stems attain their height in a few weeks at the commencement of the rains; in the Panjáb they do not harden fully during the first year." Stewart also remarks that according to the natives it accomplishes its growth in two or three weeks. Owing to the annual shedding of the leaves, there is always a large amount of dry foliage on the ground which makes forests of this bamboo liable to large and very destructive fires. The writer in the *Indian Forester* quoted above, regarding the cultivation of this species in the Central Provinces, remarks:—"It is probable that as a living plant this bamboo will come into use for the consolidation and support of embankments; the complete and endless network of rootlets which develop around every clump and extend from the surface to 9 or even 12 inches below, binds the whole surface soil into a solid mass which can be cut into blocks with a spade, but is not easily broken until the rootlets die or decay" (*Indian Forester*, IX., 529).

SOILS.
294

SOILS SUITABLE FOR *D. strictus*.—"Widely as the species is distributed it is not to be found in all localities nor on all soils. The slopes of hills, ravines, and the banks of *nalas* are the favourite localities. In the plains it occurs forming dense masses and covering large areas, but on sandy

The Male Bamboo

(G Watt)

DENDROCALAMUS
strictus.CULTIVA-
TION.

soils only. A rich and free soil, good drainage and plenty of moisture, are favourable if not essential to its production, though as already stated, it is found forming dense masses in the sandy plains, in such places it only flourishes on the banks of *nalas* or where there is a good deposit of vegetable mould. On a considerable area of poor sandy soil it abounds without attaining any size, and in such cases its existence can only be attributed to conditions being favourable to germination, and to the protection afforded to the young plants by tree vegetation.

"In clay soils, and the combinations of clay and lime (*kankar*), not unfrequently met with, the species refuses to grow. In the black cotton soils of the plains, and even in very wet soils, it will grow luxuriantly when once thoroughly established, but young plants soon succumb to excessive moisture.

"Though not very productive, pure bamboo forests exist in several places in the Central Provinces, the species thrives best when associated

forest."

REPRODUCTION.—This is "secured by seed and by rhizomes with rootlets and portions of the stems attached. In the early stage of existence the rhizomes are larger in proportion to the stems and have greater vital

"

quickly as possible, six to eight inches of stem being placed below ground. The first burst of the monsoon is the most favourable time for this operation, in the absence of rain the water-supply must be kept up artificially till foliage is developed, if the soil is good, further tending will be unnecessary, clumps thus raised on good free soil produce marketable shoots in five years.

297

"In propagating by seed sowings may be raised in nurseries and trans experience is confined to the result of dealt with was 50 acres situated on the slopes of hills. The soil was not good, though not extremely poor, but there was a little cover on the ground, the sowings were in prepared lines, but no manure of any kind was applied. The seed was put down in July but sown too thickly, and at the end of the rains the plants averaged 18 inches, or four times the height of natural seedlings of the same age, but the plants were weak. Had the soil been rich and the sowing less thick, or had the plants been properly thinned on appearance above ground, it is more than probable

Seeds.
298

DENDROCALAMUS

strictus.

The Male Bamboo.

CULTIVA-
TION.

that the growth would have been really vigorous." "It is probable that excellent results may be obtained by sowing in pits three feet in diameter and one foot deep, filled with good rich mould, provided the plants are thinned to only one or four feet in height; not more than four plants should stand in each pit." "If the seed is good more than 100 cwt to the acre is not likely to be necessary." "As bamboos need not, as a rule, be planted nearer than 15 or 16 feet, an acre of nursery will suffice for planting about 80 acres."

TIMBER
CUTTING.

299

THINNING OF CLUMPS AND CUTTING FOR THE MARKET.—"As regards cutting or thinning, it is obviously essential to preserve, in a vigorous condition, those eyes which turn out to produce shoots; it has already been established that, after clumps have produced full-sized shoots, reproduction is generally from the eyes of two years' old, though occasionally it proceeds from the eyes of greater age. It is, therefore, obvious that to secure a maximum production of shoots should be cut until the end of the second year, so according to the time in which it was itself produced, unless increased production is rendering the clump too dense, a condition which cannot be allowed to exist as long as there is ample space for the full development of foliage on all standing stems, and clear space for the upward course of new shoots."

"The main end production of shoots must prevent general seedings, which only hinder the retention of the production of shoots. It is also probable that the complete removal of the older shoots will result in the decay of the rhizomes attached to them, and that thus the stems left will become independent of the old parentage, and be less likely to seed than if they continued to be maintained. As long, therefore, as the production of shoots does not annually increase, and there is no indication of the stand becoming too dense, all shoots should be preserved till the dry season follows; the stems and rhizomes after that in which they were produced, when they should be cut and removed." The author of the interesting article on the bamboo from whom the above passages have been abstracted proceeds to state that, where a demand exists for green stems, a limited amount may be cut from each clump, but that, unless the reproduction be vigorous, they should not be cut off close to the ground but two feet above, "thus leaving eyes for the development of branches and foliage to preserve the vigour of the root."

SEASON OF CUTTING AND PERIOD WHEN THE CLUMPS COME INTO BEARING.—"With the view to production, the best season for cutting is from the time the leaf begins to fade, up to the time the clumps become leafless." The period before a wild or cultivated forest may be expected to come into bearing has been variously stated. "The number of years necessary for the production of full-sized shoots is undetermined, but is known to vary greatly according to the conditions under which the plants have grown up. In natural forests there is reason to believe that full-sized shoots are not produced until the clumps are about twelve years old, but in really successful artificial plantations the time will probably be reduced to six years. Sir D. Brandis, in the passage already quoted, states that the shoots attain their full height in a few weeks, but in the Panjāb they do not harden during the first year. This of course refers to the formation of shoots on a clump in full bearing condition. Dr. Schlich, in his Forest Administration Report of the Central Provinces, says eight years may be taken as the time in which artificially-raised bamboos of this species will, under ordinary circumstances, come into bearing."

Fibre.—The fibre from the stem is suitable for the manufacture of paper, but its high value prevents it from being so used. Kurz remarks that the natives of Behar "employ the *jungli bans* (*Dendrocalamus strictus*) for

TRADE.

Hyderabad.
314

and markets the higher value generally attaches to green bamboos, being sometimes as much as twice that of dry bamboos. As regards seasoning the preference is in some places given to bamboos that have been soaked in water for a length of time, while in others bamboos thus seasoned will not command a market. The chief use of water-seasoning appears to be the destruction of the insects which attack the bamboo when cut out of season." "Bamboos cut in the rains are always liable to speedy decay."

Particulars were called for (in connection with the preparation of the present article) as to the trade in this bamboo, its price and other such information. The reports received from the various provinces of India may be here summarised. Of Hyderabad (Berar) *D. strictus* is stated to occur chiefly in the hills of the Gawilgarh Range. It is said also to be common in Melghat—plentiful in the reserves, though disappearing from the forests. The total exports during the past ten years are reported to have been valued at Rs. 54,885, or a mean annual value of about Rs. 25,000. The local price is returned as Rs. 1-8 per hundred.

Coorg.
315

Of Coorg it has been reported:—"Chiefly used in roofing, fencing, baskets, &c.; annual sales from Government forests in Coorg 2 lakhs; price in the forest Rs. 1 to Rs. 1-8 per hundred. Probably 8 or 10 lakhs could be cut yearly from the Coorg forests without diminishing the supply. From a forest point of view it is desirable to diminish the number to a large extent and allow timber to take the place of the bamboo. If it were not for the periodic seeding and dying off of the bamboos they would gradually cover the whole forest to the exclusion of tree growth, as tree plants seldom get up where bamboos are thick. The seeding of the *D. strictus* usually takes place by clumps. Every year scattered clumps seed."

Madras.
316

Two reports from Madras may be here given:—Of the Northern Circle it has been said—"This is the 'male bamboo.' Universally found on the drier slopes of hills, and occasionally in ravines, where, as in the Nilghiris, it often attains a large size, even 3-4 inches in diameter. It is in general use for all the purposes for which bamboo is required. The annual production cannot well be given, as the supply is so much greater than the demand, but the amount exported from the Government Forests is very considerable (*See Annual Report*)."

Of the Southern Circle *D. strictus* is reported to be "common in dry forests up to 3,000 feet. It is universally used for building purposes and is in demand for spear shafts and the like. It is impossible at present to say what the annual production and amount available may be. The Government seigniorage is Rs. 1-4 per cart-load of half a ton, the collection and transport of which costs the purchasers from Rs. 4 to Rs. 5 and fetches from Rs. 6 to Rs. 9.

Ajmere.
317
Bombay.
318

The Conservator of Ajmere-Merwara writes that *D. strictus* is scarce in his district, selling for Rs. 10 per hundred. Mr. McGregor (Conservator of Forests, Southern Division, Bombay) reports that this bamboo occurs chiefly in the drier forests, but is very local. "The rate charged is one rupee per 100 stems." Mr. A. T. Shuttleworth (Conservator, Northern Division) remarks that it is very abundant in the forests, but is disappearing in parts owing to its being overworked. "It is used largely in connection with betel vine cultivation in the Thana District as props or supports." From the North-West Provinces several communications have been received. Of the Dehra Dún Division it is said to be the chief wild bamboo. "It is found in large quantities only at the eastern end of the district near and on the Siwaliks. With regard to the market, this bamboo is classified into six kinds. These are as follows:—

N.-W.
Provinces.
319

"(1) *Sarāncha*.—A hollow bamboo 6" to 9" girth, 12' long. Used for chicks, baskets, shouldari poles, &c. Annual export from

(G Watt)

DENDROCALAMUS strictus.

TRADE

Dehra Dun Division into or through Hardwār about 700 scores, at 5 annas per score

"(2) *Rakmi or Chanju*—Hollow or solid bamboos up to 6' girth and 10' long. Mainly used for thatching. Annual export as above 28,000 scores at 2½ annas per score

"(3) *Lathi*—The hollow or solid lower thick end of the bamboo used for sticks. Annual export as above about 35,000 scores at 2 annas per score. Chiefly sold to pilgrims in Hardwār

"(4) *Kain*—The 'branches' of the bamboo used for fences and in thatching small houses. About 100 headloads are exported annually

"(5) *Poochi*—The upper portion of the bamboo, above the *Sarducha*, used for thatching purposes about 9' long. Annual export about 5,000 scores at 1 anna per score

"(6) *Dry bamboos*—Ten feet long are used for thatching. About 11,000 scores annually exported at 1½ annas a score"

Of the Saharanpur Division it has been reported that "in Hindustani *Dendrocalamus strictus* is called *Moojer*, its girth is from 8" to 9", and height 70 to 80'. It germinates in March and August being the Hindi

November in the year. It is used for four purposes, viz., the topmost portion for fishing rods, the second portion for lance staves, the third for making *charhao* or *phar* of carts, and the fourth for making baskets, &c. It is sold at Rs 40 per score, and is available in Garhwal and Rampur"

Of Bengal (Chhutia Nagpur Division) the Deputy Conservator of Forests reports "Found in the Singhbhum District. Wood used for building, fencing, baskets, mats, walking sticks, spear shafts, axe handles, &c., also building houses. It is plentiful, and is sold at 4 to 8 annas per 100 in the forests"

"The male bamboo is also found in the Hazaribagh forests and in the Angul forests of Orissa. Specimens have been sent from both forests to the military authorities at Calcutta, from the former for lance staves and from the latter for army signalling. Canes were, however, pronounced more comparable for excellence as being lighter. The annual export of an

Dendrocalamus strictus, Nees, called the "male bamboo?" He presumes this is because of its reputation of having a solid stem, but he adds "I have never myself seen a stem *entirely* solid, though I have no doubt there are such. I have seen many with a very small cavity, and many more with larger ones. The Members of the Nagpur Division at Chh-

from the Moharli Forests of the Chanda Division, but there they were only found in one particular tract, on Vindhyan sandstone, which had been preserved from fire for some years previously. Boput told me at the time that the only other place where he could procure sufficiently solid stems was a certain forest in the Chindwara District, the name of

strictus.

The Male Bamboo.

TRADE.

and markets the higher value generally attaches to green bamboos, being sometimes as much as twice that of dry bamboos. As regards seasoning the preference is in some places given to bamboos that have been soaked in water for a length of time, while in others bamboos thus seasoned will not command a market. The chief use of water-seasoning appears to be the destruction of the insects which attack the bamboo when cut out of season." "Bamboos cut in the rains are always liable to speedy decay."

Hyderabad.
314

Particulars were called for (in connection with the preparation of the present article) as to the trade in this bamboo, its price and other such information. The reports received from the various provinces of India may be here summarised. Of Hyderabad (Berar) *D. strictus* is stated to occur chiefly in the hills of the Gawilgarh Range. It is said also to be common in Melghat—plentiful in the reserves, though disappearing from the forests. The total exports during the past ten years are reported to have been valued at Rs 2,54,885, or a mean annual value of about Rs 25,000. The local price is returned as Rs 1-8 per hundred.

Coorg.
315

Of Coorg it has been reported:—"Chiefly used in roofing, fencing, baskets, &c.; annual sales from Government forests in Coorg 2 lakhs; price in the forest Rs 1 to Rs 1-8 per hundred. Probably 8 or 10 lakhs could be cut yearly from the Coorg forests without diminishing the supply. From a forest point of view it is desirable to diminish the number to a large extent and allow timber to take the place of the bamboo. If it were not for the periodic seeding and dying off of the bamboos they would gradually cover the whole forest to the exclusion of tree growth, as tree plants seldom get up where bamboos are thick. The seeding of the *D. strictus* usually takes place by clumps. Every year scattered clumps seed."

Madras.
316

Two reports from Madras may be here given:—Of the Northern Circle it has been said—"This is the 'male bamboo.' Universally found on the drier slopes of hills, and occasionally in ravines, where, as in the Nilghiris, it often attains a large size, even 3-4 inches in diameter. It is in general use for all the purposes for which bamboo is required. The annual production cannot well be given, as the supply is so much greater than the demand, but the amount exported from the Government Forests is very considerable (See *Annual Report*)."

Of the Southern Circle *D. strictus* is reported to be "common in dry forests up to 3,000 feet. It is universally used for building purposes and is in demand for spear shafts and the like. It is impossible at present to say what the annual production and amount available may be. The Government seigniorage is Rs 1-4 per cart-load of half a ton, the collection and transport of which costs the purchasers from Rs 4 to Rs 5 and fetches from Rs 6 to Rs 9.

Ajmere.
317
Bombay.
318

The Conservator of Ajmere-Merwara writes that *D. strictus* is scarce in his district, selling for Rs 10 per hundred. Mr. McGregor (Conservator of Forests, Southern Division, Bombay) reports that this bamboo occurs chiefly in the drier forests, but is very local. "The rate charged is one rupee per 100 stems." Mr. A. T. Shuttleworth (Conservator, Northern Division) remarks that it is very abundant in the forests, but is disappearing in parts owing to its being overworked. "It is used largely in connection with betel vine cultivation in the Thana District as props or supports." From the North-West Provinces several communications have been received. Of the Dehra Dún Division it is said to be the chief wild bamboo. "It is found in large quantities only at the eastern end of the district near and on the Siwaliks. more with a large cavity. The Members of the Nagpur Hunt Club in my time were wont to use as spear shafts almost solid stems of <i>D. strictus</i> , as solid as they could get them, and I remember, in 1877, supplying the local but celebrated spear-maker, Boput of Nagpur, with about one hundred shafts of the almost solid stems of this bamboo, they came from the Moharli Forests of the Chanda Division, but there they were only found in one particular tract, on Vindhyan sandstone, which had been preserved from fire for some years previously. Boput told me at the time that the only other place where he could procure sufficiently solid stems was a certain forest in the Chundwara District, the name of		Spear Shafts. 324

TRADE.

which I forget. This tends to show that the solid, or almost solid, stem of this bamboo is not common, at least near Nagpur.

"It is this kind of stem, used for spear-shafts, which I have always understood to be the male bamboo. How is it therefore that the name of male bamboo is applied to the entire species?"

The Editor of the *Forester* in a foot-note to the above passages suggests that Boput might try the solid bamboos procurable in Chhutia Nagpur (Palamow or Koderma).

Solid
Bamboos.
325

The writer had numerous applications while on duty at London (in connection with the Colonial and Indian Exhibition) as to the best course to be pursued in the effort to establish an agency to supply English manufactures with solid bamboos. One dealer was desirous of procuring a regular supply suitable for lance shafts, another maker wished to obtain bamboo suitable for splitting up and afterwards consolidating the strips in the construction of fishing rods. The writer was unable to furnish the desired information, but is in hopes that the present general compilation from all available sources of information may suggest the most likely localities from which supplies might be drawn. From the above quotations, mainly from the *Indian Forester*, it would seem pretty certain that *D. strictus* in any or every locality will not do. It is necessary to select a particular area where the bamboo is known to produce stems of the required degree of solidity. This fact suggests an enquiry that would seem worthy of the attention of persons who may have the opportunity of following it out, *viz.*, as to the peculiar climate, soil, and exposure that is found to produce the more solid condition of stem. Possibly it may be found that, although belonging to the species *D. strictus*, there is a recognisable variety that possesses the desired property. From some such enquiry results of great value might be expected, such as the propagation under the required climatic condition or on the necessary soil, or if climate and soil be found of minor consideration, a wider distribution of the superior stock might be encouraged so as to establish plantations of solid bamboos in accessible regions.

Dendrocalamus Tulda, Nees, see *Bambusa Tulda*, Roxb.

Deodar. See *Cedrus Deodara*, Loudon (now recognised by Sir J. D. Hooker as *C. Libani*, Barrel, var. *Deodara*, Hook.); CONIFERÆ—see Vol. II., No. 846, p. 235 of this work.

DERRIS, Lour.; Gen. Pl., I., 549.

A genus of arborescent climbers or trees, embracing some 40 species, abundant in India, but according to the *Flora of British India*, found "belting the world in the tropics." Thwaites remarks that in Ceylon the barks of the species there met with are used by the Singalese for making ropes. Very little of an economic nature has been recorded regarding the Indian species, and only one or two need therefore be here mentioned.

FOOD and
FODDER.333
TIMBER.
334
335

Habitat.—A shrub of the Eastern Himálaya, Central Bengal, Western Gháts, South India, and Burma, ascending to 3,000 feet.

Food.—According to the Rev. Mr. Campbell, the Santals eat the fruit of this plant. He also says cattle and goats eat the leaves.

Structure of the Wood.—Yellowish, in structure resembling *D. tiliaefolium*.

Desmodium diffusum, DC.; *Fl. Br. Ind.*, II., 169.

Habitat.—A herbaceous plant, one to two feet in height, found in the plains of the Western Peninsula, Bengal, Orissa, Bundelkhand, and Burma.

MEDICINE.

336

Medicine. Sir Walter Elliot (*Fl. Andh.*, 16, 36) enters into a discussion as to the plant meant by the Telegu name *Cheppu tatta*, the *Antintulu* of some writers. In his experience these names denote *Desmodium diffusum*, but Beddome found the former given to *Coldenia procumbens*, and Ainslie assigns it (*Mat. Med.*, I., 23) to *Asarum europæum*. It seems desirable to prevent confusion between these two plants, especially as the latter is a drug of some importance (*Conf.* with *Asarum*, Vol. I., No. 1545, page 337).

FODDER.

337

338

Fodder.—Roxburgh says the foliage of this species is eaten by cattle.

D. floribundum, G. Don.; *Fl. Br. Ind.*, II., 167.

References.—Kurz, *For. Fl. Burm.*, 387; Atkinson, *Him. Dist.*, 342, 456.

Habitat.—A shrub met with throughout the Himálaya, up to 5,000 feet, also in the Khásia Hills. In Sikkim it is common in old cultivated lands at 3,000 to 5,000 feet.

[II., 168.

356

357

Detergents and Soap Substitutes.

Medically the word "Detergent" would be given to any substance which had the power of cleansing wounds, ulcers, &c. While the lists of detergents given below embrace the better known substances of that nature they have been made to include also materials employed in place of soap, either from cheapness or because of reputed special properties. A complete list of the herbs used by the natives of India as detergent poultices, or even of those employed to cleanse the hair, would indeed be voluminous. The present account of detergent materials must therefore be viewed more as suggesting the position of such articles than as an exhaustive account of them.

Perhaps the most important of the soap substitutes are the species of *Sapindus*, the fruits of which are extensively employed to purify fabrics before being dyed. It seems probable that some of these detergents exercise a chemical influence not possessed by soap. At all events, it is often contended that certain peculiar results in dyeing can be obtained only when the fabric has been first washed with certain detergent vegetable substances, and that the same result cannot be brought about if soap be used. Speaking of the fruits of *Sapindus Mukorossi*, *Gärtn.* (= *S. detergens*, *Roxb.*), and of *S. trifolius*, *Linn.* (= *S. emarginatus*, *Vahl.* & *S. laurifolia*,

D. 357

Detergents and Soap Substitutes

(G Watt) DETERGENTS

Vahl), Brandis says "The pulp makes a lather with water and is used extensively for washing, either by itself, or mixed with soap. For flannel and Kashmir shawls it is greatly preferred to soap, and some varieties are specially esteemed for washing silk." Brandis adds that the subject of these detergent nuts would "repay further study." It seems highly probable that the natives of India recognise special forms, as having definite properties, under each of the species formed by modern botanists. In the literature of the subject considerable confusion exists. Dymock

other or not, does not seem to have been investigated, and both trees are met with under cultivation throughout the greater part of India. Gamble makes practically the same remark under both species, *viz*, that the chief value of these trees lies in their saponaceous berries, which are largely used and exported as soap substitutes. Mr Baden Powell remarks "For finer washing and dyeing purposes, the skin or shell surrounding the seeds of the soap nut tree is often used. When mixed up with warm

Saponine. Several species have in their bark and roots saponaceous properties." Dr J F Royle points out that the exact nature of the principle

river banks. Some of the clays met with locally possess so high a reputation as to constitute regular articles of trade, for example, the *Multani-matt* of the bazars of India or the Fuller's-earth of European commerce.

I.—HAIR-WASHES AND DETERGENTS EMPLOYED TO REMOVE VERMIN.

The following enumeration exhibits some of the chief articles used by the people of India as hair-washes. With some of these it may be a matter of question whether they are resorted to as simple detergents, as insecticides, or as perfumes :—

- Acacia concinna*, DC. The pods.
A. Intsia, Willd. The bark, used in Sikkim.
Ajuga bracteosa, Wall. Employed to kill lice.
Albizzia amara, Boivin. Leaves used in South India.
Allium sativum, Linn. Applied along with vinegar to prevent the hair turning grey.
Andropogon Schænanthus, Linn. Used to promote the growth of hair.
Anona squamosa, Linn. Powdered seeds along with gram used as a hair-wash. [wash.
Bassia latifolia, Willd. Oil-cake used as hair-wash.
B. longifolia, Linn. Regular trade done in the oil-cake as a hair-wash.
Begonia Rex, Putreys. The juice : also employed to kill leeches.
Clay (see remark above ; also Vol. II., 361).
Cuscuta reflexa, Roxb. The seeds.
Cyperus scariosus, R. Br. The rhizomes.
Daphne oleoides, Schreb. The bark, used in Kanáwar.
Entada scandens, Benth. The seeds, used in Nepál.
Haloxyton multiflorum, Bunge. The stems and leaves.
Indigofera aspalathoides, Pahl. The ashes, used as a wash to remove dandriff.
I. tinctoria, Linn. A strong infusion of the root said to destroy vermin.
Lawsonia alba, Linn. Hair dye.
Malva parviflora, Linn. The root.
Melia Azadirachta, Linn. The seeds.
Nardostachys jatamansi, DC. Said to promote the growth of hair.
Peganum Harmala, Linn. The root, applied to kill lice.
Phyllanthus Emblica, Linn. Fruits largely employed.
Picrasma quassioides, Benn. The bark, an insecticide.
Pithecolobium bigeminum, Benth. A decoction of the leaves is employed to promote the growth of hair.
Prunus Armeniaca, Linn. The kernels (? or the oil expressed from them), used in the Panjáb as a hair-wash.
Quercus incana, Roxb. The galls.
Sapindus Mukorossi, Gært. and *S. trifolius*, Linn. The fruits.
Saussurea Lappa, Clarke. The root largely used as a hair-wash.
Sesamum indicum, Linn. A decoction made from the leaves and root is employed as a hair-wash and is supposed to blacken the hair.

NOTE.—Medicinal insecticides will be found in list III.

II.—SOAP SUBSTITUTES.

SOAP
SUBSTITUTES.
359

The list of substances used directly as detergents in cleansing fabrics or as soap substitutes in personal ablution is less extensive than those employed for washing the hair. The following may be specially mentioned :

- A. arabica*, Willd. Decoction of the bark (used in Bengal, Sind, &c).

DETERGENTS.

Detergents and Soap Substitutes.

MEDICINAL
DETERGENTS.

- Argyrea speciosa*, *Sweet*. Root used by the Santals in the cure of running sores.
- Artemisia vulgaris*, *Linn*. An infusion of the leaves applied as a fomentation in ulcers.
- Artocarpus integrifolia*, *Linn*. The young leaves used in skin diseases and the juice applied to abscesses to promote suppuration.
- Asagræa officinalis*, *Lyndl*. A decoction used to destroy pediculi.
- Avicennia tomentosa*, *Jacq*. Unripe seeds used as a poultice to hasten suppuration.
- Balsamodendron Mukul*, *Hook*. Resin used in preparation of an ointment for bad ulcers.
- B. Myrrha*, *Nees*. A detergent to cold tumours.
- B. Opobalsamum*, *Kunth*. Resin made into a paste with lard is applied in scrofulous and cancerous sores.
- B. pubescens*, *Stocks*. Resin in form of ointment may be applied to cleanse and stimulate ulcers.
- Bauhinia variegata*, *Linn*. Bark is useful in scrofula, ulcers, &c.
- Boswellia serrata*, *Roxb*. An ointment of the resin is applied to ulcers, &c.
- Calophyllum inophyllum*, *Linn*. Resin used for indolent ulcers.
- Capparis horrida*, *Linn. f.* Cataplasm of leaves useful in boils, swellings, and piles.
- Cassia alata*, *Linn*. Leaves used for ringworm and other skin diseases.
- C. Fistula*, *Linn*. Bark and leaves used in skin diseases.
- C. occidentalis*, *Linn*. Same as above.
- C. Sophora*, *Linn*. Bark, leaves, and seeds with sandal-wood regarded as a specific in ringworm.
- C. Tora*, *Linn*. Bark, leaves, and seeds used in ringworm.
- Cedrus Deodara*, *Loud*. The oil from wood used as a remedy for ulcers, &c., and for sore-feet in cattle.
- Cerevisiæ Fermentum* (Yeast). Used as poultice.
- Ceriops Candoleana*, *Arnott*. Decoction of bark applied to malignant ulcers.
- Citrus Aurantium*, *Linn*. Poultice of oranges is recommended in skin affections.
- Colchicum autumnale*, *Linn*. Used in obstinate skin diseases.
- Conium maculatum*, *Linn*. An extract used in tumours.
- Cordia Myxa*, *Linn*. Kernels employed in ringworm.
- Curcuma longa*, *Roxb*. A paste made of the flowers is used in ringworm and other parasitic diseases.
- Cycas Rumphii*, *Miq*. Resin applied to malignant ulcers; it excites suppuration in a very short time.
- Cynometra ramiflora*, *Linn*. Lotion of the leaves in milk applied to skin diseases.
- Delphinium cœruleum*, *Jacq*. Roots applied to kill maggots in the wounds of goats.
- Desmodium triflorum*, *DC*. Fresh leaves applied to wounds, &c., that do not heal well.
- Dioscorea bulbifera*, *Linn*. Powdered tuber applied to ulcers. This remark is applicable to most yams.
- Diospyros montana*, *Roxb*. The fruit, placed by *Bhistis* on the boils which generally appear on their hands.
- Dipterocarpus turbinatus*, *Gartn*. Wood oil applied to ulcers, ring-worm.
- Embelia Ribes*, *Burm*. Fruits made into various remedies for ring-worm and skin diseases.
- Ervum Lens*, *Linn*. Poultice applied to ulcers and in small-pox, &c.
- Eugenia operculata*, *Roxb*. Leaves used by the Santals in dry fomentation to sores.

Detergents and Soap Substitutes (G Watt) DETERGENTS.

	MEDICINAL DETERGENTS
<i>Ferula Nartex</i> , Boiss or <i>F. alhacea</i> , Boiss	The resin employed as a paste in ringworm
<i>Ficus bengalensis</i> , Linn	Heated leaves applied as a poultice to abscesses
<i>F. Carica</i> , Linn	Fruit used as a poultice
<i>F. Conia</i> , Buch	A bath made of the fruit and bark is regarded as a cure for leprosy
<i>Flemingia congesta</i> , Roxb	Santals use the root as an application to ulcers and swellings on the neck
<i>Garcinia indica</i> , Choisy	Kokum butter is employed in indolent sores
<i>Gardema gumifera</i> , Linn f	Gum used to keep off insects from sores on cattle
<i>Grewia asiatica</i> , Linn	Leaves applied to pustular eruptions
<i>Gynandropsis pentaphylla</i> , DC	Ointment made of the plant with Sesamum oil, is used in skin diseases
<i>Gynocardia odorata</i> , R Br	Oil used extensively in skin diseases, scrofula
<i>Helicteres Isora</i> , Linn	Fruits made into a liniment for sores in the ear
<i>Heliotropium brevifolium</i> , Wall	Juice used to promote suppuration
<i>Hibiscus esculentus</i> , Linn	Fresh capsules are employed as a demulcent and emollient poultice
<i>Hiptage Madagabola</i> , Garth	Leaves esteemed in skin diseases
<i>Holarrhena antidysenterica</i> , Wall	Fruits made into a paste to allay pain in wounds
<i>Indradentata</i> , Boiss	
<i>I</i>	
<i>I</i>	
	and cancerous affections
<i>Iunctoria</i> , Linn	An ointment is made from the extract which is used in sores. The dry powder is sprinkled over foul ulcers to cleanse them
<i>Jasminum humile</i> , Sims	The root has been found useful in ringworm
<i>J. officinale</i> , Linn	Same as above
<i>Jatropha Curcas</i> , Linn	The milky juice is said to be detergent.
<i>Kalanchoe spathulata</i> , DC	Leaves in Kangra are burned and applied to abscesses
<i>Legenaria vulgaris</i> , Seringe	The pulp used as a poultice.
<i>Lawsonia alba</i> , Lam	A decoction of the leaves applied to ulcers, sores
<i>Lepidieropsis orbiculans</i> , Mull	The bark is used by the Santals in skin diseases.
<i>Lepidagathus crustata</i> , Willd	The ashes are used by the Santals in the cure of sores
<i>Linum usitatissimum</i> , Linn	Seeds employed as a poultice
<i>Luffa acutangula</i> , Roxb., var. <i>Amara</i>	Leaves applied to sores in cattle
<i>Lycopodium clavatum</i> , Linn	Applied to boils, carbuncles, and papular eruptions, &c.
<i>Malva rotundifolia</i> , Linn	Seeds employed in skin diseases
<i>Mangifera indica</i> , Linn	The fruit is made into a poultice with linseed oil or oil is applied to cutaneous affections, scabies, &c.
<i>Melia Azadirachta</i> , Linn	Leaves made into poultice are applied to ulcers and skin diseases of long standing. Fruit is also used
<i>M. Azadirachta</i> , Linn	Leaves and bark made into poultice, which is employed in leprosy and scrofula. A poultice of the fruit is used to kill lice and to cure eruptions of the skin.
<i>Mesita ferrea</i> , Linn	A paste of the leaves with butter is used in piles.
<i>Mullethia zanzibetana</i> , Baker	P of applied to sores on cattle, &c.

DETERGENTS.

Detergents and Soap Substitutes.

MEDICINAL
DETERGENTS.

- Mirabilis Jalapa, Linn.* The leaves used as a poultice to promote suppuration.
- Momordica Charantia, Linn.* Whole plant powdered and applied in leprosy and malignant ulcers.
- Morinda citrifolia, Roxb.* The leaves used to promote healthy action in wounds, ulcers, &c.
- Nelumbium speciosum, Willd.* The root is used as a paste in ring-worm, &c.
- Nerium odorum, Soland.* The root is said to be highly efficacious in skin diseases.
- Nigella sativa, Linn., var. indica.* The seeds in combination with sesamum oil are used for skin eruptions.
- Nyctanthes Arbor-tristis, Linn.* The powdered seeds are used to cure scurfy affections of the scalp. The Santals employ a preparation of the root to cure goose-skin.
- Ocimum Basilicum, Linn.* The juice of the leaves useful in ring-worm.
- O. canum, Sims.* The leaves made into a paste are used by the Santals in the cure of parasitic skin diseases.
- Odina Wodier, Roxb.* A decoction of the bark is useful in old ulcers.
- Olea europea, Linn.* The oil is applied to skin diseases.
- Oroxylum indicum, Benth.* A powder made from the bark is employed in the cure of sore-backs of horses.
- Oxystelma esculenta, Br.* The milky sap is used in Sind for ulcers.
- Oryza sativa, Linn.* Rice poultice, largely used as a substitute for linseed.
- Pedaliium Murex, Linn.* Leaves employed as a useful poultice.
- Penæa mucronata, Linn.* The gum applied to sloughing ulcers.
- Peucedanum graveolens, Benth.* Leaves moistened with oil are used as a poultice or suppurative.
- Phyllanthus simplex, Linn.* Root applied to mammary abscesses.
- Pieris ovalifolia, D. Don.* The young leaves and buds are used to kill insects, and an infusion is employed in cutaneous diseases.
- Pinus longifolia, Roxb.* Resin used as a plaster to abscesses in order to cause suppuration.
- Pistacia Terebinthus, Linn.* The turpentine is considered very valuable in cancer.
- Pongamia glabra, Vent.* A poultice of the leaves is applied to ulcers infested with worms: the juice of the root is used as a wash for foul sores; the oil is one of the best native remedies for cutaneous diseases.
- Rhinacanthus communis, Nees.* Root-bark used in dhobi's itch.
- Saponaria Vaccaria, Linn.* Juice used as a detergent and in the cure of itch.
- Sesamum indicum, Linn.* A poultice of the seeds applied to ulcers.
- Sesbania ægyptiaca, Pers.* Leaves, as a poultice to promote suppuration.
- Tamarindus indica, Linn.* Poultice of the seeds is applied to boils, &c., and of the leaves and pulp of the fruit to inflammatory swellings.
- Tamarix gallica, Linn.* Strong infusion of galls applied to foul ulcers.
- Terminalia Arjuna, Beddome.* Decoction of bark used in ulcers and cancers.
- Thespesia populnea, Corr.* The yellow juice of fruit is used in cutaneous diseases.
- Trichosanthes dioica, Roxb.* The root is resorted to in treatment of leprosy.
- Vallis Heynei, Spreng.* Milky juice applied to wounds and sores.
- Vernonia anthelmintica, Willd.* Seeds of great repute in Sanskrit Materia Medica for white leprosy and other skin diseases.
- Vitex Negundo, Linn.* The juice of the leaves has the property of removing foetid discharges from ulcers.

Detergents and Soap Substitutes (G Watt) DETERGENTS

Woodfordia floribunda, Salisb. The powdered flowers are sprinkled over ulcers to promote granulation.
Zizyphus vulgaris, Lam. The bark is used to clean wounds and sores.

MEDICINAL
DETERGENTS,

IV—DENTIFRICES AND TOOTH BRUSHES

DENTIFRICES,
361

Materials used to clean the teeth may, as a matter of convenience, be given here under Detergents.

The following list includes those most frequently mentioned by authors—

Abutilon indicum Desf. A decoction of the bark is used as a mouth-wash in toothache.

Acacia Catechu Willd. Gutch is recommended as a dentifrice along with charcoal.

A. ferruginea, DC. A decoction of the bark is employed as a tooth-wash.

A. modesta, Wall. Twigs used by the Parsees as tooth-brushes.

Areca Catechu Linn. The burnt nuts reduced to a powder have been recommended as a dentifrice.

Anisida setacea, Poir. According to Roxburgh the stems are used in South India as tooth-picks.

Calotropis gigantea, R. Br & C. proctor, P. Dr. Twigs used as tooth-brushes.

Cassia annulata, Linn. Twigs used as tooth-brushes. A considerable trade is done in these, they are esteemed as preferable to the tooth-brushes obtained from any other plant.

Citrullus Colocynthis, Swartz. Fresh root used as toothbrush.

Cuttle-fish (or Sea-icorn). Employed in the manufacture of tooth powder.

Datura alba, Ait. Powder of the seeds used to deaden pain.

Daucus Carota, Linn. Leaf-stalks employed as tooth-picks.

Euphorbia antiquorum, Linn. Juice given in toothache.

Ficus bengalensis, Linn. Juice given in toothache.

Indigofera aspalathodes, Willd. Root used in toothache.

L. paniculata, Desf. Used in Sindh by Hindus.

DIAMOND.

The Diamond.

DENTIFRICES.

Zizyphus rugosa, Lamk. The powdered bark is employed by the Santals as a cure for toothache.

362

DEUTZIA, Thumb. ; Gen. Pl., I., 642.

A genus of highly ornamental shrubs, belonging to the SAXIFRAGEÆ, which have come into much favour by European gardeners, on account of their bunches of handsome white flowers. The rough star-shaped hairs on the leaves are serviceable in place of sand-paper, and the timber is used as fuel. The two Himálayan species are *D. corymbosa*, Brown (the *Daloutchi*), and *D. staminea*, Brown (the *Muneti* of KUMAON; *Deutsch*, SIMLA; *Phul Kanvi*, HAZARA; *Phurilé*, KASHMIR; *Sai*, CHUMBA; and the *Aruchi* or *Deús* of BASHIRH).

Devil's Tree and Dita Bark, see *Alstonia scholaris*, R. Br., Vol. I., [No. 870.

363

Dextrine or British Gum.

A chemical substance present in most grains, having the formula $C_{12}H_{10}O_{10}$. Wheat contains 4.5; wheat-bran, 5.52; barley, 6.55; rye-bran, 7.79; malt, 8.27. In commerce the term is applied to the substance artificially produced by the transformation of starch—the granules on bursting under the influence of heat constitute British Gum. This is largely used in calico-printing, paper-glazing, gumming envelopes and postage stamps. It seems probable that a very large proportion of the Rice exported from India to Europe is employed in the manufacture of Dextrine. See *Oryza sativa*.

Dhal, see *Cajanus indicus*, Spreng., Vol. II., No. 49.

Dhourra, a name often given to the millets collectively.

Dhub or Dub, see *Cynodon Dactylon*, Pers., Vol. II., No. 2558.

The Diamond	(G Watt)	DIAMOND.
-------------	----------	----------

WHERE
FOUND
365

(the former of which probably afforded the Golconda diamonds, a name given to them from the ancient kingdom of Golconda), and, *third*, Chutia Nagpore and the Central Provinces to Bundelkhand

It is somewhat remarkable that the Indian diamonds have not as yet

the lessened trade in modern times is more due to the conservative character of the diggers, in keeping their art a secret or to the exhaustion of the

in addition to the above explanation, to the discovery of the stone elsewhere, and to the application of cheaper methods of working diamond mines in other countries than are known to the people of India

For centuries the Indian mines have been held by poor workmen who undaunted by science, have had to depend on their hereditary skill while

large extent been lost. At the same time it should not be forgotten that the diamonds which found their way all over the civilized world from the Indian mines—the *Adamas* of the Greek and Latin writers—may have largely represented the surplus accumulation of gems collected during many previous centuries

Some of the oldest Sanskrit writers allude to the diamond, and it appears to have been worn by the nobility of India long anterior to the earliest European mention of it. At the same time it is significant, as Mr. Ball points out (*Economic Geology of India*, p. 3), that the

DIAMOND.

The Diamond.

HISTORY.

Hindus are not now and probably never were professional diamond diggers. The greater part of the Indian mines are worked by Gonds or Kôls; for, as Mr. Ball adds, "the miners in South India, though some of them are said to be Hindus and others are simply described as low out-castes, all probably came from the same family. It may, of course, be said in answer to this that the mining and washing would naturally fall to the lot of Helot races; but in some of the localities it is doubtful whether the Aryans ever held paramount power." It would not, therefore, be a great stretch of imagination to picture the aboriginal races of India using diamonds as playthings prior to the Aryan invasion, as putting in fact little more value on them than the Negroes of Brazil did, who employed their diamonds as counters in games of cards. The Aryans bringing with them wealth and enlightenment might be supposed to have soon given to the Indian gems their true value, while leaving the art of digging in the hands of the aborigines in whose country they were found. Everything, therefore, points to India having always had a limited and conservative diamond-mining community with whom it might be easily supposed the art, under adversity, would not have continued to prosper. Even assuming that the first washings of the surface beds afforded a richer yield than the subsequent re-washings of the same materials (and this is admittedly what has actually taken place), there still remains the fact that few gems have in modern times been discovered that are in any way equal to those now in the possession of the great monarchs of the world—gems, the individual histories of which are lost in the obscurity of a remote antiquity. The view may thus be admissible that the Royal Diamonds have been handed down from generation to generation, and that each represents an accidental discovery, a it marks as period of human history. The prevalent opinion, advanced by the early writers and held still by the modern Indian diggers, as to "diamonds growing," accounts for the persistence with which the same materials have been searched over and over again; and it has its explanation in the fact that the natural disintegration of the matrix brings to light stones not discovered in a former washing, from their having been closely encrusted by earthy materials. But the theory of growth has been exploded both by the chemist and the European digger. The diamond is now known to be a crystalline state of pure carbon, formed under geological influences, of which analytical research may be said to have established the rationale, but which constructive or synthetical efforts have at most only approximated towards demonstrating. We may decompose the diamond but cannot make it.

One of the older European writers who visited India and wrote of the diamond (John Huyghen van Linschoten) describes it as growing:—

"Diamonds," he says, "by the Arabians and Moores called *Almas* and by the Indians, where they grow, *Iraa*,* and by the Malayans, where they are likewise found, *Itam*."† "They grow in the countrie of Decam behinde Ballagate, by the towne of Bisnagar, wherein are two or three hills from whence they are digged, whereof the King Bisnagar doth reape great profite: for hee causeth them to be straightly watched, and hath farmed them out with this condition that all Diamonds that are above twenty-five Mangelyns in waight are for the King him selfe (every Mangelyn is foure graines in waight),‡ and if anie man bee found that hideth anie such, he looseth both life and goods. There is yet another

* *Hîrâ*, Sans.

† The Malay name *Iutan* comes from the Javanese *Huilen*, which, again, is derived from the Sanskrit.

‡ According to Mr. Ball in Tavernier's time (*Econ. Geol.*, p. 27) "a Mangelin = 1½ carats or 7 grains at Raolconda and Coulour; the rati being ¼ of a carat or 3½ grains. But 1843 grains is more probably the correct equivalent of the Hindû rati."

refers to the most recent large diamond found in India (1881). It came from the Bellary district, and was purchased by the firm of Messrs. P. Orr & Sons of Madras. When cut as a brilliant of the purest water it weighed 24½ carats. This, as a kind of parody on *Koh-i-nur*, received the name of *Gor-do-Norr* in honour of the senior partner of the firm, Mr. Gordon Orr. On the other hand, many writers hold that the *Koh-i-nur* was so named by Nadir Shah (the Persian invader of India in 1739) from whose successor in 1813 it passed into the hands of Runjit Sing. In 1849 on the annexation of the Panjáb it again changed hands, and was presented shortly after to Her Majesty the Queen-Empress of India.

On the other hand, a much greater antiquity is sought to be established for the *Koh-i-nur*. A legend asserts that it was found in one of the mines in the Kistna district, and was worn 5,000 years ago by Karna, one of the heroes celebrated in the *Mahábhārata*. It is then said to have passed through many hands until presented to Bábar, the founder of the Mogul dynasty in 1526, and thus descended to Aurengzeb, son of Shah Jahán. Tavernier, however, expressly states that it came to the Mogul Emperors in the time of Shah Jahán, and it is significant also that Abul Fuzl, in his *Ain-i-Akbári*, while dwelling at length on the high personal character and great wealth of Akbár (the great-grandson of Babár), makes no mention in the list of Court jewels of any diamond that could compare with either the Great Mogul or the *Koh-i-nur*. In the *Tuzuk-i-Jahángíri* some interesting facts are given regarding the Court jewels in Jahangir's time (son of Akbár), but no mention is made of the Great Mogul, so that Tavernier's statement may be accepted as correct that it came into the hands of the Mogul Emperors during the reign of Shah Jahán (son of Jahangir). This would not, however, preclude the possibility of its having been in the possession of the Kings of Golconda for many previous generations, or even detract from the probable accuracy of the tradition that it was once worn by Karna. Indeed, the king of a region from which the majority of the great diamonds were obtained, might fairly well be expected to have retained in his own family some of the best gems ever found. This is the more easily admissible when it is recollected how futile had been the efforts to conquer the diamond king, and that even Shah Jahán owed some degree of his ultimate success to the treachery of Miringola.

A far greater difficulty exists in tracing the Mogul diamond after the date of its having been inspected and weighed by Tavernier. On the death of Aurangzeb, the Mogul Empire rapidly fell, and from 1720 it may be said to have begun the final stage of breaking up. In 1739, the Persian invader Nadir Shah overthrew what vestiges remained of the Great Muhammadan Empire—an empire that had lasted for over two hundred years, *viz.*, from Bábar to Muhammad Bahádar Shah, the last of the race of Timur. The Persians sacked the city of Delhi and carried off money and treasure to the value of 32 millions sterling, including the Great Mogul Diamond.

Tavernier does not, however, say that that gem was found a hundred years before the date of his visit to Aurangzeb, but that the Coulour mines were opened out then. The great diamond might have been picked up centuries before, although, as pointed out above, Linschoten's silence as to the existence of any one exceptionally large diamond might be accepted as leading to an opposite inference. Some capital has been made out of Tavernier's contradictory statements regarding the weight of the gem when presented to Shah Jahán—in one place 900 ratis = 787½ carats, in another 907 ratis = 793½ carats. But it should be borne in mind that that was only the weight he was told it then possessed, and he may be

DIAMOND.

The Diamond.

POSITION
AND
PROSPECTS.

extent in the Kurnool basin, especially on its western side. They have been mined at Bunganapully, Moonimadoogoo, and Goorramcondah in the latter district. At Ramalcottah and several other places in Kurnool district diamonds were, and are still, obtained by washing local alluvia formed of the *débris* of the diamond conglomerate. At and near Chenur, in Cuddapah district, the gravel beds in the alluvium of the Pennair river, which consists largely of *débris* of rocks belonging to the Karnool system, were formerly washed on a large scale, though now almost abandoned. Considerable tracts of the diamond conglomerate—the ‘Bunganapully conglomerates’ of the Geological surveyors—have been left untried as yet by the native miners. Conglomerate beds belonging to the Cuddapah system were formerly mined for diamonds in the Kistna district, where deserted villages occur in great numbers to the north and west of Chintapully. To this set of mines belonged the old workings at Collor, on the Kistna, which has been identified, on good grounds, with the Gani Coulour of Tavernier, where the Koh-i-nur was obtained. The Ramalcottah and Bunganapully mines and workings appear still to yield a remunerative supply of small and rough diamonds; the right to mine being sold at a yearly auction. The so-called Golcondah mines, either of Gollapully near Ellore or in some parts of the Golcondah range of the Eastern Ghauts north of Rajahmundry, have been long deserted.”

Hyderabad.
372

NIZAM'S DOMINIONS.—“When the Nizam ceded the Northern Circars to the British, he was permitted to retain possession of all the village lands of this area in which diamond mines were situated, and these villages now stand isolated in the British Kistna and Godavari districts. The revenue derived from them by the Nizam at present from ordinary agricultural resources is not inconsiderable; but the diamond mines yield little or nothing. Eighty years before Heyne's visit, or about the beginning of the eighteenth century, they belonged to a powerful zamindár called Ooparow, but on his discovering the diamonds they were taken possession of by his sovereign the Nizam.” Some of these mines have already been alluded to, such as the Kollur (Color). In that mine it is now generally believed the Koh-i-nur was found, and not at Partial, though it seems fairly certain the Pitt gem was found at the latter. The expert presently examining the mines in Hyderabad has published certain facts of interest. His communication has been discussed as follows in the *Pioneer*:—“The workings are very extensive, some being five miles in length. They are all of a superficial character, not extending below 15 feet from the surface. Wherever water or rock was met the native workers could not compete with the difficulty. The soil indications are said to be extremely satisfactory, and in many places similar to those found at Kimberley and elsewhere in South Africa. Although the diamond workings have not been carried on since the beginning of the century, a few individuals still employ themselves in re-washing the old *débris*, and the expert was shown one or two small diamonds found by them of fairly good colour.” The report alluded to describes the primitive method pursued in washing and sifting for the diamonds, the information given being concluded with the following:—“By the 26th January the expert had again started from Secunderabad for Purtyal with a convoy of 80 bullock carts carrying all the necessary machinery for testing and working the different places described by him. He states that he hopes to be able shortly to send a further report in the shape of a parcel of diamonds.” He adds:—“It is of course not in my power to be able to say with any certainty that I shall find diamonds in payable quantities, but I do not suppose for one moment that the diggings are worked out, particularly as the natives have not worked the ground regularly but have left ground untouched between

all the pits which is of the same soil and, therefore, just as likely to be diamond bearing as the pits themselves." He concludes: "I have every confidence in the venture, but do not like to be over- sanguine, and as it will not be very long before the ground will be thoroughly tested, I prefer to confine myself to saying that the chances are very much in favour of success."

taken place within the last 50 or 60 years. With regard to the quantity of diamonds found, Mr. Mottie states that he has never seen more than a few hundred in any one place.

CENTRAL PROVINCES, SAMBHALPUR DISTRICT.—Mr. Ball states, "exists as to how far the diamond-bearing localities of Gondwana are applicable to the district of Sambhalpur." "The first visit to Sambhalpur, of which account is described in the narrative of a journey made by Mr. Mottie in the year 1766. The object of this journey was to establish a regular trade in diamonds with Sambhalpur, Lord Clive being at that time employing diamonds as a convenient means of payment to the natives."

The Governor proposed to Mr. Mottie to make the purchase a joint concern, in which," writes the latter, "I was to hold a third; but the other two, all the expenses to be borne by the concern. The proposal distressed me and I caught at it without reflecting on the difficulties of the march or on the barbarity of the country, &c." "In spite of his life being several times in danger from attacks by the natives, the loss of some of his followers by fever, and a varied character of the country, Mr. Mottie was successful in his mission."

between the island and the right bank, about 10 miles above Sambhalpur." In the *Medical Topography of the Districts of Ramguri, Chutia Nagpur, Surgooa, and Sambhalpur* (dated 1873) further additional information is given regarding the Sambhalpur diamonds, which fixes the diamond region on the north side of the river. A large diamond is said to have been found in 1809 in these mountains. The diamond weighed 2106 carats and to have been treasured by the natives of the Mahrattas. Nothing further has been heard of this diamond, but it is presumably one of the great gems the history of which is given in the *Central Provinces Gazetteer*, upon which authority it is stated that the diamonds of Sambhalpur are of the best quality and that some of the older writers on the contrary state that they are of the worst quality. In the *Imperial Gazetteer* it is simply stated that diamonds are found near an island called Hrakunda or Diamond Island.

The Diamond.

POSITION
AND
PROSPECTS.

pur was finally taken over by the British in 1850, the Government offered to lease out the right to search for diamonds, and in 1856 a notification appeared in the *Gazette* describing the prospects in somewhat glowing terms. For a short time the lease was held by a European at the low rate of Rs200 a year, but it was soon given up. Mr. Ball adds that, though reports are often made of diamonds found at Sambulpur, "recent local inquiries failed to elicit a single authentic case, and the gold-washers asserted that these statements were incorrect."

Of the mines in the Chanda district it may be said that, although these are of considerable extent and are most probably the Bairagarh mines mentioned in the *Ain-i-Akbari*, Mr. R. Jenkins, in his report on the territories of the Rajah of Nagpur, states "that they were formerly celebrated, but in his time did not yield sufficient returns to make them worth working."

Bundelkhand.

374

BUNDELKHAND, PANNA.—In the *North-Western Provinces Gazetteer* (Vol. I., *Bundelkhand*, p. 565) will be found a detailed account of the past and present of the Panna diamond mines. This has been condensed and reproduced in the *Imperial Gazetteer* as follows:—"The ground on the surface and for a few feet below," says Mr. Thornton from whom this paragraph is compiled, "consists of ferruginous gravel mixed with reddish clay; and this loose mass, when carefully washed and searched, yields diamonds, though few in number and of small size. The matrix containing in greater quantity the more valuable diamonds lies considerably lower, at a depth varying generally from 12 to 40 feet, and is a conglomerate of pebbles of quartz, jasper, hornstone, Lydian stone, &c. The fragments of this conglomerate, quarried and brought to the surface, are carefully pounded; and after several washings to remove the softer and more clayey parts, the residue is repeatedly searched for the diamonds. As frequently happens in such speculative pursuits, the returns often scarcely equal the outlay and the adventurers are ruined. The business is now much less prosperous than formerly, but Jacquemont did not consider that there were in his time any symptoms of exhaustion in the adamantiferous deposits, and attributed the unfavourable change to the diminished value of the gem everywhere. The rejected rubbish, if examined after a lapse of some years, has been frequently found to contain valuable gems, which some suppose have in the interval been produced in the congenial matrix; but experienced and skilful miners are generally of opinion that the diamonds escaped the former search in consequence of encrustation of some opaque coat and have now been rendered obvious to the sight from its removal by fracture, friction, or some other accidental cause. More extensive and important than the tract just referred to is another extending from 12 to 20 miles north-east of the town of Panna and worked in the localities of Kamariya, Brijpur, Bargári, Maira, and Etwa. Diamonds of the first water, or completely colourless, are very rare; most of those found being either pearly, greenish, yellowish, rose-coloured, black or brown." Sir W. W. Hunter adds that, according to Pogson, "inexhaustible strata producing diamonds exist here." "None of the great diamonds now known appear to be traceable to the mines in Panna, and Tieffenthaler mentions it as a general opinion that those of Golconda are superior." During the prosperity of the mines a tax of 25 per cent. was levied on their produce, but the tax now imposed is stated to exceed this rate. The revenue is divided in proportions between the Rajahs of Panna and Charkhári. The value of the diamonds still found in the mines is estimated at £12,000 per annum." Mr. Ball gives a brief account of these mines written by Mr. Medlicott and a picture of the miners at work in a shaft as seen by the late Mr. Jules Schaumburg.

DICHOPSIS
elliptica.

Indian Gutta-percha.

India-rubber—is obtained from several widely different plants, Gutta-percha proper is only obtained from the Sapotacea family and mostly from one or two species of *Dichopsis*; the inferior forms obtained from other plants can at most be called Gutta-percha substitutes.

379

Habitat.—A large tree of the Western Ghâts, extending from Bombay to Kanara, and ascending to an altitude of 4,000 feet. *Beddome* says it is a common tree in all the moist sholas of the Western Ghâts, also in the Wynaad, Coorg, Travancore, &c.

GUM.
380

Gum.—This tree yields the Indian Gutta-percha or *pala* gum, a substance which has attained a certain amount of popularity as an adulterant for Singapore Gutta. It is stated that as much as 20 to 30 per cent. may be used without the characteristic properties of the Gutta-percha being destroyed. To Mr. Lascelles and General Oullen should be attributed the honour of having brought this substance prominently before the public; the latter gentleman recommended, amongst many other uses, its adaptability as a cement. *Balfour* describes the juice as obtained on tapping the trees—a process quite different from that resorted to in the Malay Peninsula with Gutta-percha. The following passage from *Drury's Useful Plants of India* gives a full account of this substance:—

“The exudation from the trunk, which has some similarity to the gutta-percha of commerce, is procured by tapping, and the quantity is not inconsiderable; but it would appear that the tree requires an interval of rest of some hours, if not days, after frequent incision. ‘In five or six hours,’ says General Oullen, ‘upwards of 1½ lb (more than a catty) was collected from four or five incisions in one tree.’ Again, he writes in the same month (April): ‘Incisions were made in forty places, at distances nearly 3 feet apart, along the whole trunk. The quantity produced was 2½ *dungalies* (a *dungaly* is about half a gallon), the reeds were placed again, but in the evening no more milk was found; but the bark is thin, and the juice soon ceases to flow, although there is plenty of it in the tree.’ The gum when fresh is of a milky white colour, the larger lumps being of a dullish red. Specimens of the gum were forwarded to England to be reported on by competent persons, and on an analysis of its properties, Messrs. Teschemacher & Smith stated: ‘It is evident that this substance belongs to the class of the vegetable products of which caoutchouc and gutta-percha are types, and that it greatly resembles ‘birdlime’ in its leading characteristics, but in a higher degree. It is evident that, for water-proofing purposes, it is (in its crude state) unfit; for, although the coal-tar, oil of turpentine paste, might be applied to fabrics, as similar solutions of caoutchouc now are, and a material obtained impervious for a time to wet, yet that, owing to the capacity of this substance to combine with water and become brittle in consequence at ordinary temperatures, such a water-proofed fabric would become useless very quickly. We do not of course in any way imply that, in the hands of some inventors, this and other difficulties to its useful application may not be over-

GUTTA-PERCHA.

References.—*New Report for 1881* gives a long account of Gutta-percha, which has been freely consulted in drawing up the present abstract; *Spens' Encyclopædia*; *Journal of the Agri. Hort. Soc.*; *Government of India Proceedings*; *Baden Powell, Panjab Products*; *Indian Forester*, Vol. VIII., 205-209; *Encyclopædia Britannica*, Vol. XI.; *Tropical Agriculturist* (numerous articles in the volumes for the past four or five years); *British Manufacturing Industries* (Stanford's series) by Collins; *Society of Arts for 1844*; *Dr. Montgomerie's Lecture on the Discovery of Gutta-percha*; *Balfour, Cyclopædia of India*; *M. C. Naudin, in Bulletin, Minist. de l'Agri., Paris, Dec. 1888, &c., &c.*

A commercial term for the inspissated milky sap of several plants, of which nearly all (or at least all the important ones) belong to the natural order SAPOTACEÆ. The word gutta-percha is of Malayan origin; it signifies the gum or gutta of the tree known as percha. The gutta-percha of commerce is, however, chiefly the *gutta-taban* or *Dichopsis Gutta*, a tree of Perak. As it reaches the market the gum is largely adulterated, often consisting of the inspissated saps of some five or six different plants mixed together, of which a fig and a bread fruit tree, which yield inferior India-rubbers, are probably the most frequently used. Gutta-percha seems to have come into commercial notice in Europe in the year 1845 (from the Straits), its important uses soon causing an immense demand. It was probably known as mazer-wood at a much earlier date, and in 1822 Dr. W. Montgomerie experimented with it, and in 1844 read a paper on the subject before the Society of Arts, London. From that date it became a regular article of commerce. It is principally employed in coating telegraphic cables, owing to its being a perfect insulator, while it is of such a nature as to withstand, in a remarkable degree, the action of water. It is in fact much more durable when entirely submerged than when exposed to a moist atmosphere. About 10 years have been stated to be the period it will withstand the variations of climate in the air; 20 years if enclosed in iron tubes; but 20 years, when it has been submerged, have no appreciable effect upon the article. This is due to the fact that under the influence of light and air it slowly becomes oxidised, being converted into a brittle resin soluble in hot alcohol. This is the great defect of Gutta-percha, for, when oxidised, it loses its plastic nature. Under water and at great depths in the sea, it is, however, very durable, hence its value as an insulator for submarine cables. Chemically, gutta-percha is almost identical with India-rubber, but it differs physically, being tough and inelastic.

Since the date Gutta-percha was made known to Europe, perhaps no substance has developed more rapidly, and, with India-rubber, its uses may be said to be so many and so important as to make it perfectly indispensable to commerce.

The immense demand has caused an extended enquiry all over the globe with the view of expanding the field of supply or discovering substitutes in sufficient abundance likely to meet the demand without endangering the extermination of the supply of plants. As far as Gutta-percha is at present concerned, there cannot be a doubt but that a few years more will suffice to eradicate the supply from the Straits Settlements. It has been estimated that to meet the shipments of gutta-percha from Sarawak alone during the years 1854-75 over 3,000,000 trees were felled. Great Britain imported in 1880 from the Straits Settlements 62,862 cwt. of gutta-percha, valued at £505,821. The expansion of the trade may be said

Gutta-percha Substitutes.

(G Watt)

DICHOPSIS.

to be demonstrated by the fact that in 1876 the imports were only 19,665 cwt, but were two years later 49,387 cwt. The present total annual trade in gutta-percha has been estimated at 10,000,000 lb. The future prospects are so bright and such that not only should the Colon at Ceylon

Another interesting feature, which the increasing demand for Gutta-percha must solve, is the possibility (in a simple way) of transforming the

tive alphabetical places in this work. The following abstract may, however, prove useful:—

1. *Achras Sapota*, Linn; SAPOTACEÆ. (See Vol. I., A, No. 376, page 80.)

page 198.)

One of the many forms of this tree has recently been discovered to be the source of the *Gutta-percha* of Singapore. The *Sapotia* has long been known in India as yielding an inferior India-rubber, but it is doubtful if this could be regarded as anything more than an adulterant for Gutta-percha.

- 3 *Bassia Mottleyana*, De Vriese, SAPOTACEÆ. (See Vol. I., B., No. 221, page 416.)

A tree of Malacca and Borneo, known in the vernacular as *Sotian*. Mr. Mottley says that this tall and straight tree, when wounded, yields a copious flow of milk which, when heated, is softened by heat.

4. *Calotropis*

171, page 331

The *madar* or *akanda*, a plant scarcely to be distinguished from the following species, the properties and uses of which are identical, and these plants may therefore be discussed jointly. *C. gigantea* is most abundant in the Lower Provinces and Eastern India, while *C. procera* is the species chiefly met with in Upper or Northern and Central India.

5. *Calotropis procera*, R. Br.

Reference.—*Agri-Hort. Soc. Ind.*, VIII., 107, 226, 231.

The inspissated and sun-dried milky sap from the stem resembles Gutta-percha. The *madar* is, in fact, the most interesting and most hopeful plant not belonging to the natural order *SAPOTACEÆ*, which can be said to yield a substance resembling Gutta-percha ever likely to obtain a commercial reputation as a Gutta-percha substitute. Mr. Liotard publishes, in his Memorandum on the Materials in India suitable for the Manufacture of Paper, the opinion of Professor Redwood upon *Madar-gutta*. The Professor considers that it possesses many properties in common with the Gutta-percha of commerce. The specimen so reported upon was collected by Captain G. E. Hollings, Deputy Commissioner, Shahpur (in the Panjáb) in the year 1853, little more than one year after the date of the original discovery of this Gutta. We have learned nothing further in 30 years, and uncountable riches of fibre and gum may have all the while been wasting along every roadside and over every rubbish heap.

6. *Dichopsis elliptica*, Benth.; *SAPOTACEÆ*.

The *puncheti*, a large tree of the Western Ghâts; yields the Indian gutta-percha.

7. *D. Gutta*, Benth. & Hook.

It is said that the finest quality of all the guttas is the *Gutta-susu*, obtained from a botanically undetermined plant. This is very scarce, but the best commercial quality is that obtained from *D. Gutta*.

There are two forms, one with red flowers known as *tuban-merut*, and the other with white flowers, *tuban-patch*. The young trees require shade and a rich well-drained soil, hence the preference for hill-sides. No special period is observed for collecting the gutta, but it is said to be generally collected at the close of the rains. Full-grown trees, say, 20 years old, are hewn down and tapped all along at distances of 18 inches. The yield is so variously stated that it does not seem desirable to quote the contradictory reports. A mistake seems often to have been made between the yield of sap, the yield of fresh gutta-percha, and the yield of dry gutta-percha. The weight of sap would of course be far greater than that of gutta-percha, and on drying the commercial article loses as much as 30 per cent. of its weight. It seems probable that the yield of dry gutta-percha per tree may average from 2 to 1½ lb. The sap is of course drawn from the middle layer of the bark, the region of laticiferous vessels. The fresh milk or latex appears under the microscope as an emulsion, a clear liquid having in it minute globules of caoutchouc. It is supposed that the caoutchouc is held in suspension in the juice through the agency of ammonia. At all events, many of the fresh milky saps like that of gutta-percha have an ammoniated odour and the addition of a little ammonia prevents the natural coagulation due to evaporation. The value of a Gutta-percha or India-rubber depends on the proportion of caoutchouc granules which it contains and on the relative absence of certain oxidised, viscid, resinous substances, soluble in alcohol. The formation of such materials is greatly prevented by a rapid evaporation of the milk. The crude sap, if in small quantities, may be concreted by rubbing between the hands, but it is more expeditiously accomplished by boiling.

Singapore and Penang are the chief collecting depôts.

8. *D. obovata*, Clarke.

An evergreen tree of Tenasserim, extending to Malacca and Penang. According to Kurz it yields gutta-percha.

9. *D. polyantha*, Benth.

Vern.—*Tali*, BENG.; *Sill-kurta*, CACHAR.

Gutta-percha Substitutes

(G. Watt)

DICHOPSIS.

A tree, 30 to 40 feet in height, occurring in Sylhet, Chittagong, and Pegu. Kurz remarks that it produces a good quality of gutta-percha in large quantities.

10 *Gutta Sundek*, the second best commercial form of gutta-percha, is at present un-identified. It occurs abundantly in the Malay Peninsula. M. Beauvisage named it as *Keratephorus Lecru*, *Husk*, but the Kew authorities regard this as incorrect, and Dr. Trimen, who, in the Ceylon seedlings, thinks it

Habitat.—A moderate-sized evergreen tree, met with in Cachar, Chittagong, and Arakan.

GUM.

393

Gum.—Kurz says it produces a good quality of Gutta-percha in large quantities—probably little inferior to that of Singapore. The Conservator of Forests, Assam, in a letter to the Inspector General, dated 10th November 1884, reported that this tree was well known to the people of Cachar and Sylhet, but although he had “often asked the people about its yielding Gutta-percha,” he had “never heard of it being extracted or made use of, except that it is mixed sometimes with India-rubber, and in doing so the people of course sell themselves, as they always get much less for mixed rubber than for pure. I have referred the matter to the Deputy Commissioner of Sylhet and the Cachar Forest Officer to make sure.” “I have ordered the Cachar Forest Officer to make an experiment to ascertain how much a tree will yield and to let me have the stuff collected to allow of its being valued.

“The following is the result of the above experiment, but the writer has not been able to discover the report, if obtained, of the commercial value of the Gutta-percha collected in Cachar:—

“I had 36 trees tapped, giving a yield of 15 pounds of dry Gutta-percha. To ascertain the yield per tree I have recorded the yield of six trees, the tapping of which was personally superintended by me. The milk was weighed directly it was taken from each tree separately. Then the whole was boiled down in an iron pan over a slow fire. The result is that 6 seers 11 chattacks of milk yielded $2\frac{1}{2}$ seers of Gutta-percha or third the weight of milk.” The Forest Officer seems thus to have tapped the trees after the same manner as with India-rubber trees, whereas in Gutta percha-producing regions the trees are felled. It is probable that a much larger yield would have been obtained had the Straits method been followed. This is not however mentioned by way of recommending the destructive system of felling the trees, but only to prevent unfavourable comparisons being drawn as to the yield.

Yield.

GUM.

393

Gum.—Kurz says it produces a good quality of Gutta-percha in large quantities—probably little inferior to that of Singapore. The Conservator of Forests, Assam, in a letter to the Inspector General, dated 10th November 1884, reported that this tree was well known to the people of Cachar and Sylhet, but although he had “often asked the people about its yielding Gutta-percha,” he had “never heard of it being extracted or made use of, except that it is mixed sometimes with India-rubber, and in doing so the people of course sell themselves, as they always get much less for mixed rubber than for pure. I have referred the matter to the Deputy Commissioner of Sylhet and the Cachar Forest Officer to make sure.” “I have ordered the Cachar Forest Officer to make an experiment to ascertain how much a tree will yield and to let me have the stuff collected to allow of its being valued.

“The following is the result of the above experiment, but the writer has not been able to discover the report, if obtained, of the commercial value of the Gutta-percha collected in Cachar:—

Yield.

394

“I had 36 trees tapped, giving a yield of 15 pounds of dry Gutta-percha. To ascertain the yield per tree I have recorded the yield of six trees, the tapping of which was personally superintended by me. The milk was weighed directly it was taken from each tree separately. Then the whole was boiled down in an iron pan over a slow fire. The result is that 6 seers 11 chattacks of milk yielded $2\frac{3}{4}$ seers of Gutta-percha or one-third the weight of milk.” The Forest Officer seems thus to have tapped the trees after the same manner as with India-rubber trees, whereas in the Gutta-percha-producing regions the trees are felled. It is probable that a much larger yield would have been obtained had the Straits method been followed. This is not however mentioned by way of recommending the destructive system of felling the trees, but only to prevent unfavourable comparisons being drawn as to the yield.

D. 394

A domestic febrifuge—Dichroa, (G. Hoff.) **DICHROSTACHYS cinerea.**

It does not appear how often the trees were tapped, in other words, whether they yielded all that it was possible for them to do. At the same time the above experiment is instructive, each tree having on an average yielded a little over a seter of milk, one-third of which consisted of Guttapercha. The average yield of true Guttapercha from the tapped trees has been variously stated, but it may be said to vary from 2, 4 to 7½ per tree, the maximum recorded yield being 22½ according to some writers, so according to others, and even 100 is given by one author. This seems highly improbable. (See the remarks, p. 102, regarding mistakes of yield arising from the milk being spoken of in some reports, as either the fresh rubber, or a third the dried rubber.)

Food.—The flowers are said to be eaten.

Structure of the Wood.—Red, hard, much valued in Cochin and Cutching. Major says it does not float, but he is probably referring to green wood. Major Lawr remarks that it is used in Cutching for making beds, table legs, and is very much valued for the Cochin market. For further information regarding Guttapercha see India rubber.

DICHRON, Linn.; Gen. Pl. Vol. I. 60.

Dichroa febrifuge, Linn.; F. & G. Ind. To. II. 401; Smith.

Syn.—*Alchornea cordata*, Vahl; *A. cordata*, Forst.
Vern.—*Shal, Shal; Hindi, Shal; Kannada, Shal; Nepali, Shal; Sinhalese, Shal; Burmese, Shal.*

Is an interesting tree in the Lower Himalayas of India. It is common in the lower Himalayas, and is found in the lower part of the Himalayas.

References.—*F. & G. Ind. To. II. 401; Smith, Ind. To. II. 401; Cat. Trees, Simla, and Catalogue of Plants, &c.*

Habit.—An evergreen shrub, common in the forests of the Eastern Himalayas (5000 to 10000 feet), from Nepal in the north, and in the Eastern Hills, above 4000 feet.

Medicine.—The bark and the fruit of the tree are made into a decoction and used as a febrifuge in the Himalayas (Hornb.). The latter says this drug is given in cases of the malarial.

Structure of the Wood.—The wood is hard, and is much valued for its moderate hardness, as very fine medicinal wood.

Domestic Uses.—Employed in the Eastern and Southern parts of India in religious ceremonies.

DICLIPTERA
Roxburghiana.

Dichrostachys.

Royle, *Him. Bot.*, 182; Liotard, *Dyes*, 33; Watson's Report, 18; Balfour, *Cyclop.*, 946; Raj. Gaz., 29; Indian Forester, Vols. III., 202; IV., 232; VIII., 30; XI., 156; XII., 33; App., 2; Gazetteer, N.-W. P. (Bundelkhand), Vol. I., 80; (Agra), Vol. IV., LXXI.

Habitat.—A thorny shrub or small tree of the dry, stony hills of the N.-W. Provinces, Western and Central India, Rajputana, Madras, Ceylon, &c. Distributed to the Malay Islands, Northern Australia. Doubtfully distinct from *D. nutans*, a native of Tropical Africa.

Gum.—It is said to yield a gum, but of this nothing is known.

Dye.—The lac insect is often found on the tree.

Fibre.—Mr. J. W. Cherry of Salem, Madras, sent to the Calcutta International Exhibition a sample of a yellowish white good bast fibre which was said to have been obtained from this plant.

Medicine.—The young shoots are bruised and applied to the eyes in cases of ophthalmia.

Fodder.—The leaves are mixed with corn and given to riding horses (*Ainslie*). It is supposed to free them from both bots and worms.

Structure of the Wood.—Heartwood red, extremely hard; weight 70 to 80 lb a cubic foot. Used for walking-sticks. It is, however, too small to be of much use, but is much valued for tent pegs.

DICLIPTERA, Juss.; Gen. Pl., II., 1120.

Several species of this genus are alluded to in the Gazetteers and other descriptive works on India. Some are cultivated in gardens, while others are referred to as wild. (See *Agra Gazetteer*, p. lxxvi; Sir W. Elliot's *Flora Andhrica*, pp. 38 and 183, for *D. parvibracteata*, the *Chiku velaga* of Telugu; Stewart's *Account of Hasora*, where *D. Roxburghiana* is said to be one of the more remarkable of the herbaceous plants (also *Bundelkhand Gazetteer*, p. 83, &c., &c.).

[THACEÆ.

409 *Dicliptera Roxburghiana*, Nees, *Fl. Br. Ind.*, IV., 553; ACAN-

Vern.—Kirch, *somni*, *lakshmana* (bazar name), PB.; Bouna, SIMLA.

References.—Roxb., *Fl. Ind.*, Ed. C.B.C., 42; Voigt, *Hort. Sub. Cal.*, 492; Dals. & Gibs., *Bomb. Fl.*, 196; Aitchison, *Cat. Pb. and Sind Pl.*, 113; Atkinson, *Him. Dist.*, 373; Balfour, *Cyclop.*, 946.

Habitat.—According to the *Flora of British India* there are two forms of this plant—the one met with on the plains of India, the other on the hills. Regarding the former there seems little doubt, but with the latter it is quite otherwise. It is the hill plant alone which requires to be dealt with in this work, and this fact has necessitated the writer's examining the specimens in his private herbarium with as much care as the time at his disposal would admit of. A sample of the plant collected at Simla was by him sent to the authorities of the Royal Herbarium, Kew, the result being that it was pronounced "*Dicliptera Roxburghiana*, Nees, var.?" Presumably, it may be the plant described in the *Flora of British India* as var. *bupleuroides* (*sp. Nees in Wall., Pl. As. Rar.*, III., p. 111). The writer would be more disposed, however, to place the Simla plant in another genus than to amalgamate it with *D. Roxburghiana*. The following are the chief characteristics of the two plants as recognised by the writer:—

α *D. Roxburghiana*, Nees.

Syn.—This is apparently not the *Justicia chinensis*, Linn., as described by Roxburgh, since that plant is said to have, among other distinctive characters, cordate leaves.

A tropical species, specimens of which in the writer's herbarium are in flower, and dated February to May. Leaves with a short petiole ($\frac{1}{4}$ to $\frac{1}{2}$ inch), nearly glabrous.

In young trees the leaves are sometimes as much as two feet in length. The tree flowers in March and April, and is frequently associated with *sál* in the forest-clad lower hills of the Central table-land.Fibre.—Cordage is said to be made of the bark. (Lisboa, *U. Pl. Bomb.*, 2.)Food.—The flowers, buds, and fruit when green are eaten by the natives. The berry is said to have an agreeable acid flavour, resembling that of *Grewia asiatica*. The fruit is also greedily eaten by animals. (*Kanara Gazetteers*.) In Thana the deer are said to be specially fond of these fruits.

Structure of the Wood.—Rough, moderately hard, reddish-grey; apt to split, warp, and crack; strong, heavy, durable, handsomely marked on a vertical section by the darker-coloured medullary rays which appear as broad plates. Weight 41 to 50 lb a cubic foot; growth moderately fast.

It is used for construction, ship-building, rice-mills, and for charcoal, which is of good quality. In Kanara it is considered useless except for burning; in Thana the wood is also regarded as worthless. Lisboa, however, in his special botanical volume to accompany the *Bombay Gazetteers*, says: "the wood is very strong, hard, heavy, porous, coarse-grained, durable, &c." He adds that it is "used for house and ship-building, buggy-shafts, rice-mills, and charcoal."

Domestic Uses.—The leaves are sold in the bazar at Poona as a substratum for thatching. (Daleell and Gibson.) It is stripped of its leaves and pollarded, in Kanara, to afford leaf-manure. The old rough leaves are employed to polish ivory and horn.

D. pulcherrima, Kurz.; *Fl. Br. Ind.*, I., 37.Vern.—*Byú*, BURM.

Habitat.—A large tree in the tropical forests of Pegu, Prome, and Martaban, ascending to 1,000 feet in altitude.

Structure of the Wood.—Hard and strong, used for rice-mills, but the trunk usually remains low and crooked (*Conf.* with *Indian Forester*, VIII., 416).*Dindiga Gum*; see *Anogeissus latifolia*, Wall.; Vol. I., No. 1149, p. 256.

History of Yams —Modern usage has assigned to the tuberous roots of the various cultivated species of Dioscorea the name of Yam. It is generally stated that Yam is derived from a West Indian or an American word passing through the Spanish and Portuguese languages.

HISTORY
OF YAMS.
450

"Moreover, it produces great abundance of inhamas, or large subterranean tubers of which there are many kinds, like the camottes of America, and these inhamas boiled or roasted serve in place of bread." The

Dioscoreas—Yams.

HISTORY.

what he calls "*Iniamos*" and "*Batatas*." He speaks of them as "fruits"—a mistake made by most early writers, and which, indeed, has not been completely eradicated from popular fancy even at the present day, for the words vegetable and fruit are often used as synonyms. Speaking of yams, however, Linschoten says: "These *Iniamos* are as bigge as a yellow roote" (is carrot meant?), "but somewhat thicker and fuller of knots and as thicke on the one place as in the other, they grow under the earth like earth Nuts, and of a Dunn colour, and white within like earth Nuts but not so swēcte. The *Batatas* are somewhat more red of colour and of fashion almost like the *Iniamos* but sweeter, of taste like an earth Nut. These two fruits are verie plentiful, specially *Iniamos*, which is as common and necessarie a meat as the *Figges*" (he alludes here and throughout his work to '*Plantains*,' which by mistake was translated '*Figges*'), "they cate them for the most part roasted, and use them commonly for the last service on the boorde, they sieth them likewise in another sort of porrage, and sieth them with flesh like Colwartes or Turnops, the like doe they with *Batatas*." Now to remove all doubt as to the Indian so-called *Iniamos*, which were, 300 years ago, so "verie plentiful" and "necessarie" as plantains to the people of the west coast of India, a further quotation may be given from Linschoten, where he returns again to the subject of *Iniamos*. Speaking of the Azores he writes: "They have likewise in that island a certaine fruite that groweth under the earth, like Radishes or other roots, but the plants are trees like vines but different in leaves, and groweth longwise upon the ground; it beareth a fruit called *Batatas*, that is very good, and is so great that it weigheth a pound, some more, some lesse, but little esteemed, and yet it is a great sustenance and foode for the common sort of people. It is of good account in Portingall, for thether they used to bring it for a present, and those of the Ilande by reason of the great abundance doe little esteeme it." Now, whatever may have been the *Batatas* as distinct from the *Iniamos*, one point is certain—neither can for a moment be supposed to have been Aroids. They were "vines" with leaves of a peculiar form (a remark that suggests the striking foliage of most *Dioscoreas*), and they were "vines" so large that he pronounced them "trees like vines." The use of the word "trees" almost precludes the idea of an *Ipomœa* (or *Convolvulus*), and the habit of creeping on the ground gives weight to the supposition that by *Batatas* he meant simply another form of *Iniamos*, the more so since the natives of India and of many other countries regularly allow one or two species of yam (or *Dioscorea*) to grow along the ground instead of affording them the means of twining. The sub-woody stems of most *Dioscoreas* might fairly well be viewed as admitting the expression 'trees,' whereas that word would be wholly inapplicable to the sweet-potato. One can hardly presume Linschoten to have failed to specialise the foliage if it had (as in the case of the sweet-potato) a resemblance to a plant with which he was probably quite familiar—the *Convolvulus*. It is much more natural that he used the word *Batatas* because that word had just then reached Europe. He evidently preferred to adopt words known in Europe to giving the native names; had he mentioned the Indian vernacular names also instead of using foreign words only—*Iniamos* and *Battas*—much of the confusion that now exists would have been saved. Dr. Paludanus, in a foot-note to Linschoten's account of yams (or yams and sweet-potatoes), says: "*Iniamas* were this year brought hether out of Guinea as big as a man's legge and all of a like thickness, the outward part is dun-coloured, within verie white, roasted or sodden they are verie pleasant of taste, and one of the principal meates of the Black [?Moors]." In 1597, the very time Paludanus wrote this note, Gerarde was experimentally cultivating the sweet-potato in his garden

which is now known as
'THE POTATO.' The latter tuber was taken to Europe after the sweet-
potato, and in the words of Yule and Burnell (*Glossary of Anglo-
Indian Terms*) may be said to have robbed it of its name. This is more
than an interesting historic fact. The frequent allusion to the *inhames*
being used "in place of bread" suggests the possibility of the sweet
cassava (*Mamhot Aipi*) being the plant referred to, and
if so the European form of the
the wrong plant. Thus sweet

Alu said to be an Aroid.

HISTORY.

and, indeed, the literature of even the potato has to some extent got mixed up with that of the above allied tubers. A similar confusion exists in India. The potato and sweet-potato are undoubtedly modern introductions, but there are many wild species of *Dioscorea* scattered over the whole of Peninsular India, some peculiar to the hot, damp, tropical plains, others to the drier tracts, while a third set ascend to temperate regions and are met with throughout the Himālaya at altitudes up to 9,000 feet above the sea. That being so, the presumption may be admissible that most of the forms of yam met with under cultivation in India are probably indigenous also, even though in some cases they are not now known in a wild state. The name *ālū* by universal modern acceptance is given, however, to the potato, and that word is by no means recent in Indian classical literature. It can be traced into some of the early Sanskrit works. It is there applied to a farinaceous tuber—perhaps to several such tubers—being, in its earliest meaning, generic more than specific. Sir Walter Elliot (*Flora Andhrica*) gives the Telegu words *Allu* to the millet—*Paspalum scrobiculatum*; *kandulu* to the pulse—*Cajanus indicus*; *alachand alu* to the pulse—*Vigna Catjang*; and *Machi-kanda* and *Pāti-kanda* to *Amorphophallus*. We have no alternative, therefore, but to assume that the potato on being brought to India received an ancient name, and further, that the superior properties of the introduced tuber gradually displaced the indigenous one from public favour. According to Professor Wilson, and more recently to Yule and Burnell, the *ālū* of early Indian classics was an aroid and most probably *Amorphophallus campanulatus* (see *Dict. Vol. I., A. 996*). But *Amorphophallus* is a distinctly tropical genus of Aroideæ and does not extend beyond the Himālaya. If therefore *ālū* was originally given to an aroid it may have denoted a species of *Arisæma* (to some extent an extra-tropical genus), but in India the members of that genus are all poisonous and none of them are cultivated.* Mr. John Crawford, in a most valuable paper on the *Migration of Cultivated Plants in reference to Ethnology (Selections in the Agri.-Hort. Soc. of India Jour., Vol. I., New Series, 1868, p. 15)*, says, that the word *ālū* had a generic meaning with the Hindūs of Upper India, being equivalent to *kalangkū* with the Tamil-speaking people and *ubi* with the Malayan nations. He is also disposed to view *ālū* as having been originally applied to an aroid and “not to the yam with which as an extra-tropical people the Sanskrit-speaking race must have been unacquainted.” While not prepared to dispute an opinion held by so many high authorities, the writer may be permitted to say that he would be more disposed to accept a *Dioscorea* as having been the plant to which the word *ālū* was applied when it first received (and probably in India) a restricted or specific meaning. But even the idea of “an extra-tropical people” can have little weight, since various species of *Dioscorea* are temperate Himālayan plants and are distributed even to Afghānistan. Aitchison, for example, found *D. deltoidea* in low scrub from 7,000 to 8,000 feet in altitude, near Shālizan in Afghānistan.* Unless *ālū* be taken as a form of *olla* (a Sanskrit name for *Amorphophallus*, from which the modern Bengali term *ol* is derived), there are probably no other references in Sanskrit literature to *ālū* that could with any degree of certainty be accepted as alluding to an aroid. But the question may fairly well be asked, as against the argument resting on the Sanskrit-speaking people having been “extra-tropical”—how did the tropical *Amorphophallus campanulatus* come to get its early Sanskrit names? There are several well-known Sanskrit synonyms for that aroid, such as *surana*, *kanda*, and *arsaghna*. In none of the modern languages of India does *Amorphophallus* bear a name traceable to *ālū*, while the Sans-

Kachalu.
459

ultimately the name *Colocasia* itself. Mr Baden Powell mentions a curious fact, namely that in the bazars of the Panjáb the tubers of *Dioscorea deltoidea* are viewed as the *kachalu* collected from old plants. On the other hand, in nearly every dialect of India, *alu* is, at the present day, the generic name for the *Dioscoreas*, the species being indicated by qualifying or descriptive prefixes. It is noteworthy also that the Tamil name -onyms of *alu*—should now be written as Ainslie should give English Yam). He tells us just then been introduced 1 error (in assuming the cor-

lattice work and to as, therefore, a climber, and the description of the leaf precludes it from having been the sweet-potato. In another page both the *Kachalé* and the *Suran* are described, so that the *Pindalu* could not have been an aroid. Throughout

Hindu general name is *alu* preceded by a special name for each species or variety; *kamalu*, for instance, is *Dioscorea alata*. The absence of distinct names in each province also argues a recent cultivation.* A reference to the vernacular names given under each species (in the pages which follow) will show that even this last conclusion is not well founded. In most of the languages of India there are several names for the species (wild and cultivated) of *Dioscorea*—every shade of cultivated form frequently having its distinctive name.

DIOSCOREA.

Kriss—the Yam.

HISTORY.

It may be admissible that most of the cultivated plants which the invading Sanskrit-speaking people found in Hindústan, and which were unknown to them before their arrival in India, received from them Sanskrit names (or Sanskritised forms of their aboriginal names), or had old generic Sanskrit names in time restricted or specifically applied to them. It would, indeed, be unsafe to assume that the pre-Aryan people of India did not possess some wild or cultivated plants of value which were unknown to their conquerors. The Santals and other aboriginal races have names for most of the *Dioscoreas* which have no connection with the Sanskrit names for these plants. Thus the Rév. A. Campbell tells us that *D. bulbifera* is known to the Santals as *Piska*, and that its tubers are considered a "great delicacy." In Bombay that plant is known as *mar-páshpoli*. *D. glabra*, Mr. Campbell also says, affords edible tubers, which are known as *Ato sang*, and *D. globosa* the *Bengo nari*. In many parts of Western India *D. pentaphylla* is known by the name *álsi* or *úlsi* (*ufi*, *ubi*, *papa*, are American names). The name *kriss* seems to be the most general for the species of *Dioscorea* in the Panjáb, but that name is practically confined to the hill tribes; the tubers when offered for sale are known as *tarar*, a name that at once brings to mind the Malay *tallus*, *tales*, the Otahitan *tallo* or *tarro*, and the Bombay *terem*, names for *Colocasia antiquorum* (*Conf. with Dict. Vol. II., C. 1731*). The *Ain-i-Akbari* (1590 A.D.) describes what appears to be a Yam under the name of *Tarri*. It is said to grow mostly in the mountains and to produce tuberous roots so large as to suggest the resemblance to a "mill-stone." It is spoken of as a creeper with leaves resembling those of the water-melon (*Blochmann's Transl., p. 71*). Atkinson affirms that in Kumáon *D. sagittata*, Royle, is known as *tair* and *turar*, words which (with the Panjáb *tarar*) may be admitted as recalling one of the generic names,—*tega*—which Sir Walter Elliot states is, with the Telegu-speaking people, a synonym for the Sanskrit *pindáluh* (see also *Wilson, Sanskrit Dict., p. 384*, and *Heyne, Tracts on India, p. 55*). The commonest Telegu generic name for all the *Dioscoreas*, Elliot informs us, is *pendu lam*, which he points out is the equivalent to the Sanskrit *pindáluh*. Under *Chára kanda* (*Colocasia nymphaeifolia*), Sir Walter draws attention to the fact that Brown, in his *Dictionary*, is incorrect in assigning Wilson's account of the *pindálu* to a *Colocasia*; Elliot makes no mention of *álú* or any form of that word as applied to any aroid. Thus, it may safely be affirmed that throughout India there are names for the *Dioscoreas* that belong to the languages of the aboriginal races as well as those that are of a more classical character, the latter most frequently approaching to the word *álú*, while a third set of names may have been derived from foreign and mostly American sources.

It seems probable that, as articles of food, the *Dioscoreas* of the world were cultivated at a much later date than most other vegetables, probably on account of the fact that without the trouble of cultivation they afforded an unfailing supply of food. The ancient Egyptians were not aware of the value of these tubers, and, indeed, they are doubtfully cultivated (or only to a small extent) in the Egypt of to-day. The volume of existing evidence on the origin of the cultivated *Dioscoreas*, however, points to a possible independent discovery in Asia, America, and Africa. Interchanges from these regions might easily have taken place down to the present time, and the knowledge of the properties of these useful cultivated tubers may be assumed to have thus become widely and rapidly diffused. From the Indian source cultivated forms may have been carried to the West Indies, or others brought from the West Indies to India during the period of Dutch and Portuguese influence. DeCandolle states that

Yam is often applied to any tuber.

(G Watt) DIOSCOREA.

in Mauritius a yam bears the name of *Cambare marron*. "Now, he adds: *Cambare* is something like the Hindu name *kam*, and *marron* indicates a plant escaped from cultivation." But this derivation ignores the fact that *Camotes* is a Mexican name for the sweet potato, so that the syllable "Cam" in American words and *Khām* in Indian, need be viewed as nothing more than a coincidence. On the other hand, many writers

Camotes,

number and abundance on passing into the Eastern Peninsula. They are, however, nearly as abundant on the Western coast, but become rare

&c., &c., are all designated yams. This fact has compelled the writer, in drawing up the present account of the species of *Dioscorea*, to reject all descriptions of yams in which he could not, from internal evidence, discriminate the plant or plants referred to. This has naturally deprived him of more than half the economic information that exists on the subject of yams, and has reduced very considerably the list of vernacular names that doubtless might be given for the species of *Dioscorea*. It may here

key to any re-arrangement that may be found necessary on the Indian species of *Dioscorea* being re-determined and described. Even in cases

466

Sûrana, and *ola* or *ollâ* in Sanskrit and in the vernaculars; it is also *Kand* in the vernaculars as *Tini-kand* (Edible tuber). *Sûrana* is derived from *sîr* to hurt; all the wild kinds are very irritating. In Marathi the name *Sûran* seems to be applied to all Aroids having the peculiar shaped tuber of *Amorphophallus*.

"As regards yams we find purely Sanskrit names in the vernaculars, such as *Pûsh-poli*, from *pûsh* a noose, and *poli* a cake, Anglic—strangle-cake, since the wild kinds irritate the throat and cause a sensation of strangling. This name is current in Marathi for wild yams, which are also called *Manda*, a Marathi name for a cake like a mincecake, full of *Rawa* and sugar instead of mince-meat.

"Cultivated yams are called *kon* and *konphal* in Marathi, *kand* in Hindi and Guzerathi, from the Sanskrit *Kanda*. This word spelt *Kanda* is applied to all tuberous roots and bulbs in Marathi just as it is in Sanskrit. Another Marathi name for cultivated and uncultivated yams is *Chûin* or *Chôyn*. The Sanskrit names *alu* and *kanda* are about as vague as the *Bolbos* of the Greeks, but we know that *sûrana* means *Amorphophallus* from the epithet *Arso-ghna* or 'destroyer of piles' applied to it, for it is still used as a remedy for piles."

Dr. D. Prain's note has special reference to the distribution of the species of *Dioscorea* and of *Arisæma* :—

"I have gone through the whole of the works dealing with the 'Orient' of Boissier and the 'Central Asia' of the Russian writers, and I find that none of them mention either *Colocasia* or *Amorphophallus*. Boissier's Supplement brings our knowledge down to 1888, and Trautvetter's Incrementa to 1884, while Maximowicz's last paper (*Mel. Biol.* XII.) brings us also down to March 1888.

"*Arisæma* finds no place in the pages of Russian authors. In the *Flora Orientalis*, V., 43, Boissier describes *A. abbreviatum*, but he states that he had not seen the plant, and he gives only Aitchison's Kuram Valley Flora locality. In the App. to V. (p. 734) he adds *A. Jacquemontii*, also from Aitchison's Kurram plants, remarking that he has seen the plant himself. He does not, however, give any other locality for either species, nor does he mention any economic uses.

"No *Dioscorea* appears in Ledebour, the standard Russo-Siberian Flora. Maximowicz gives *Dioscorea 5-loba* in *Print. Flor. Amur. et Mand.* He mentions no other in any of his 'diagnoses' (of which he publishes the 12th paper this year), nor does Trautvetter l. c., who brings the Russian Flora up to date at intervals.

"Boissier notes (under *Tamus*), on Baker's authority, that Aitchison had found *D. deltoidea* in Kurram, but for all that he does not provide a description of it in his Flora. I find no mention under the families you refer to of any edible tuber, either in Boissier or in the Russian authors."

CULTIVATION OF YAMS IN INDIA.

The yam may be propagated by means either of the aerial tubers which form on the stem or by means of small under-ground tubers or portions of large ones. The aerial tubers are not, however, often used, as the plants in that case require two years to reach maturity. The usual process is to dig the ground to a considerable depth and to manure it fairly well; then form pits near trees, so as to afford support for the climbing stems, and deposit in each pit a small tuber or portion of a large one. Lateral shoots should be nipped off, otherwise large tubers will not form. If it be desired to plant an area of ground entirely with yams, the ground should be trenched and the tubers deposited two feet apart along the furrows. To afford support for the plant a trellis work should be constructed between the ridges. The Chinese

Dioscoreas—Yams

(G Watt)

DIOSCOREA.

have a method of producing a large crop of small tubers without having to incur the expense of providing a support for the plants. The tubers are planted 3 or 4 feet apart along the crest of ridges, and the stems made to take root at various points by being pinned down on the ridges. By this means a crop of tubers very much like potatoes is produced, the tubers forming at each point where the stem is pinned down into the earth. It is often the case in India that the long stems are not provided with a support nor are they pinned down. They are simply allowed to spread over the ground. This is a slovenly practice and results in much smaller tubers than when the stems are provided with a means of climbing. Firminger states

and delicious food. In fact, the Buck-yam is superior, in the opinion of many, to the best potato.

"I am also conducting experiments in the Hill near Hope Town at different elevations with these yams, with the kind co-operation of Messrs. Johnstone and Calvert, who have planted several at lower elevations. The first I planted in March, at 5,200 feet above sea level, rotted almost without exception before the roots and germinal shoots from the bark had time to appear. I, therefore, waited until May and planted out fifty more which had already sprouted, and most of them grew up and looked healthy.

Intro-duced
forms not
suited to the
hills.

475

"The result of this hill experiment will also be communicated to you. I fear, however, that at elevations above 3,000 feet, the yam can scarcely prove a valuable addition to the root crops of the hills, being too much of an exotic. In the plains, however, where the rainfall is not less than fifty inches and fairly distributed, and the soil arenaceous and moderately good, the West Indian yam should prove a valuable addition to the food of the people. It requires from seven to eight months to attain to its full growth, and should be provided with sticks to run on, although a small patch, which was not supplied with poles, produced about as much as the rest of the ground where a bamboo trellis was provided to support the vines.

Water Yam.

476

"My father and I have experimented on yams for many years. I obtained from Barbadoes some of the finest varieties of the water yam, which in that island seldom exceed eight or ten pounds in weight. In Trinidad, however, the plants thrive amazingly, and the weight was increased. In one instance a yam which I had dug and weighed myself turned the scale at 82lb, and many others averaged from 30 to 50lb; moreover, these enormous yams did not in any way deteriorate in flavour, and proved quite as delicate as the original stock.

62 lb. in
weight.

"Should you arrive in Calcutta before the vines wither, about X'mas time, I should have much pleasure in showing you the patch of yams at present under experiment.

Manure.

477

"The cultivation is simple, but laborious. The ground is dug into trenches about two feet wide by eighteen inches deep, three feet apart from centre to centre. The trenches are filled with leaves, weeds, and garden rubbish of all kinds, which admit of the free expansion of the tubers. The mould from one trench forms the bed over the preceding one. The soil being uniformly good it does not matter much where the sub-soil is placed; if poor I should put it beneath in direct contact with the accumulated vegetable matter and out of the way of the young rootlets, seeking the nourishment which they would be more likely to find among the humus of the surface soil.

Tubers.

478

The yams, cut to about the size of an ordinary man's fist, care being taken to preserve as much of the outer surface as possible, are planted at intervals of three feet in the beds. The tops in the absence of seeds are the legitimate plants, and rarely fail to grow.

Seed.

479

Seeds were procurable made excellent plants. There are seasons, however, when few, if any, appear—why I am unable to say—although this has also been a subject of experiment. As far as I have observed, however, the coarser varieties bear seeds most abundantly and frequently.

Mode of
sprouting.

480

"I prefer sprouting the pieces of yam cut for plants under a layer of grass and mould a few inches thick, which should be watered at intervals. The seed bed should be prepared in the end of March, or early in April, when the seasons are similar to the weather in Calcutta. In from 3 to 6 weeks the yams commence to sprout and should be planted out at once, as the young shoot, which grows with great vigour and rapidity, even in the corner of a dark room on a stone floor, soon weakens the parent."

The Prickly-stemmed Yam

(G. Watt)

DIOSCOREA
aculeata.

The writer would wish it to be understood that since a monograph of the Indian species of *Dioscorea* has not as yet been published, the following notes must be viewed as an attempt to relegate existing information to the species probably concerned. When the species have been examined, however, considerable departures from the present arrangement may doubtless be found necessary, the names and synonyms having to be changed.

bulbifera.

Bulb-bearing Yam.

493

Dioscorea Batatas, Decaisne.Vern.—*Sain-in*, CHINESE.References.—*DeCandolle, Origin Cult. Pl.*, 78; *Agri.-Hort. Soc. Ind.*, IV., *New Series* (1874), p. 40.

Habitat.—Extensively cultivated in China, but not hitherto found wild in that country. Was early introduced into Europe, where it may occasionally be found under cultivation, though it has not attained a high reputation as a vegetable; but it is the most temperate of the cultivated species hitherto brought to notice, and is thus the one which might succeed best in the higher alpine regions of India.

According to some writers this is only a cultivated state of *D. glabra*, *Roxb.*, and on this account mainly is it mentioned in this work, since apparently the cultivated plant as described by Decaisne is not grown in India.

Suitable for
hill cultivation.

Pl.*, 182; *Lisboa, U. Pl. Bomb.*, 179; *Birdwood, Bomb. Pr.*, 178; *Sir W. Elliot, Fl. Andh.*, 110.

Habitat.—Wild in Sylhet, Chittagong, and throughout the Western Gháts to Bombay. Cultivated in the Western Presidency, especially in the Konkan. It is also mentioned by Aitchison as occurring at Moradabad and Simla, and is enumerated by Strachey and Winterbottom as met with at Almora, flowering in July. Baden Powell refers to samples of this tuber having been sent to the Lahore Exhibition from Simla, Kashmir, and Hushyarpur. (*Conf.* with the tuber described under *D. deltoidea*, which is specially mentioned by Aitchison as collected at Hushyarpur.) Baden Powell accepts the tubers sold under the name of *Zamin khand* as being those of this species. Of the *karanda* yam of Poona it is said that it differs from the *kon* (*D. alata*) in having rounder leaves and in bearing bulbs on the stems as well as on the roots. Elliot says that *D. bulbifera* was introduced into India from the Straits.

See p. 130.

MEDICINE.
Tubers.

495
Leaves.
496

FOOD.
Tubers.
497

Medicine.—The TUBERS are applied to ulcers after being dried and powdered. In the plains of the Panjáb the LEAVES of a species of *Dioscorea* (most probably this) are used medicinally and sold under the name of *tara puttr*. Baillon (*Dictionnaire de Botanique*, Vol. II., p. 437) alludes to the known febrifugal property of the leaves of certain species of *Dioscorea*, rendering them useful in the treatment of intermittent fevers.

Food.—The bulbules on the stems and the tubers under ground are used as vegetables (*Birdwood*). The latter are bitter, but are rendered eatable by being covered with ashes and steeped in *khar* water, or in an acid on Assam it is stated that the tubers are boiled in *khar* water, or in an acid before being eaten. The Rev. A. Campbell says that cattle eat the leaves.

Dr. Stewart, under the name of *D. deltoidea*, Wall., "(and *D. bulbifera*, L.?)" gives the following vernacular names: *kniss*, *kriss*, *tar*, *kithi*, *tardí*,

D. 497

Yams used as Detergents	(G Watt)	DIOSCOREA deltoidea.
<p><i>gengrú, kaspat, &c.</i>, and states that the plant he refers to grows abundantly in many parts of the Panjab Himálaya, that the root (several pounds in weight) is largely eaten, cooked, by various classes in parts of the Siwaliks and outer hills, after steeping it in ashes and water to remove acidity. It is difficult to know to which of the Panjab species Stewart more particularly refers. He says that in Kashmir the roots are employed for washing pashm and wool cloth. Vigne (Stewart further informs us) affirms that a smaller kind is used to wash cotton cloth, and a third reputed to be used for wool.</p>		FOOD.
<p>it is fit to be eaten. It is used also as pickle. For this purpose it is cut into little pieces and fried in oil till it becomes of a red colour, and then it is put into vinegar, &c., or in the mixture of mustard seeds ground up with salt, &c., in water or oil which is sometimes used as a preservative."</p>

The Kidney-shaped Yam or Karen Potato.

of Simla and throughout Kulu, being distributed into Afghánistan. The deltoidly often trilobed leaves of this plant are very characteristic, but the small flowers occur on a lax, elongated axis in a manner peculiar to this plant.

The above Panjáb vernacular names are taken from Stewart's *Panjáb Plants*, but it seems probable they are the names not for one species of *Dioscorea* but for all those met with in the Panjáb Himálaya. These names are, from a historic point of view, of great interest, and are reproduced here (and also under *D. bulbifera*) in the hope that future writers may be able to properly distribute them to the species to which they more especially belong. Aitchison, in his *Catalogue of Panjáb and Sind Plants*, mentions three species—*D. sagittata*, *D. bulbifera*, and *D. sp.*, undetermined. Regarding the last he says that it is found near Hushyarpur and "yields a large tuber, much sought for at certain Hindu feasts. The ground where this grows is one mass of pits from the continuous digging for the tubers called *Thurí*." It has been repeatedly urged that much damage is done to young seedling trees by the deep pits dug throughout the forests while searching for yams.

Detergent.—Stewart, in his Notes on a Tour in Khághán, mentions the *krís* tubers as used for washing silk.

Medicine.—The LEAVES of this species are sometimes spoken of as employed medicinally, having febrifugal properties assigned to them. The TUBERS are detergent and are utilized in dyeing (*Conf.* with *D. bulbifera*).

Dioscorea fasciculata, Roxb.; *Fl. Ind.*, Ed. C.B.C., 728.

THE KIDNEY-SHAPED YAM; KAREN POTATO.

Vern.—*Sisnt álú*, *sathui*, BENG.; *Suthni*, BIHAR; *Kangar*, POONA; *Kadwa-oo*, *tá-tway-u*, BURM.

References.—Voigt, *Hort. Sub. Cal.*, 652; Mason's *Burm.*, p. 464, 813; Kurz, *Prelim. Report, Pegu*, XXII; Grierson, *Bihar Peasant Life*, 250; Firminger, *Man. Gard.*, 122; *Bomb. Gaz.*, XVIII., 56.

Habitat.—"Cultivated to a considerable extent in the vicinity of Calcutta, not only for food but to make starch of the roots." (*Roxb.*) It is cultivated extensively by the Karens, and, being more like the potato than the yam, has acquired the name of the Karen potato or Tavoy potato. Mason adds: "I am not aware that it is ever found wild on the coast." Kurz mentions this species, in his *List of Pegu Plants*, but does not state whether gathered from a wild or cultivated stock. According to a writer in the *Bombay Gazetteer*, this species, known as *kangar*, is grown in Poona.

Description.—The root consists of several small, smooth, light-coloured tubers, which are used by the natives for food and for the manufacture of starch. (*Roxb.*)

Mason describes this species as follows: "This is a small yam, not much larger than a kidney potato, which it much resembles both in appearance and taste." "It is the best vegetable we have, but unfortunately it can be obtained during a few months only in the year." The Poona yam referred to above is described as "closely resembling the *kou* (*D. alata*) and the *karanda* (*D. bulbifera*). It is found in the hills. Its bulbs, which form below the ground, are like a small sweet-potato in size and shape. The flesh is white and sweet" (*Poona Gaz.*, XVIII., 56). Firminger remarks that the *súsní álú* is "a very distinct kind of yam; the tubers are about the size, form, and colour of large kidney potatoes, and when well cooked bear a greater resemblance, in mealiness and flavour, to the potato than any other yam I know."

Campbell, Econ. Prod.*, *Chutia Nāgpur*; *Müller, Extra-Trop. Pl.*, 107; *Drury, Hand-book of Indian Fl.*, 111., 275; *Trimen, Cat. Ceylon Pl.*, 93.

Habitat.—A native of the east and west coasts of Southern India, extending north to Khandalla; of frequent occurrence in the sub-alpine forests. Flowering time the rainy season. Stems smooth, round, slender, twining, annual; leaves opposite, petioled, ovate-lanceolate, slightly cordate; inflorescence panicleled. Distributed to Ceylon and China.

Food.—The Rev. Mr. Campbell reports:—"The roots and the ærial TUBERS are eaten, the former being considered by the forest tribes as a great delicacy." This remark probably refers to *D. bulbifera*—one of Mr. Campbell's specimens of *piska* is certainly *D. bulbifera*—Dymock enumerates this plant among those used during famine time in Bombay, both the tubers and the flowers being eaten.

Fodder.—In the Santal country cattle are said to eat the leaves.

Medicine.—"The root, ground and heated, is applied to reduce swellings: it is also used in snake-bite and scorpion sting."

Pl.*, 183; *Lisboa, U. Pl. Bomb.*, 179; *Birdwood, Bomb. Pr.*, 179.

Habitat.—Common in the jungles, on low hills throughout the greater portion of India.

Wight remarks: "A sufficiently common species in jungles on low hills, &c., but never, so far as I have seen, cultivated, which is the more remarkable as I have always found the natives dig the tubers, whenever they had an opportunity to dress and eat them." Roxburgh says he has only seen this plant in its wild state. It occurs on the lower Himalāya ascending to 6,000 feet in altitude; is common a little below Simla.

Description.—The stems are prickly and furrowed, rather hairy; leaves digitately 5-divided, downy, segments oblong acuminate. The tubers oblong, large, and white, considered wholesome and palatable.

Food.—Affords large edible TUBERS, eaten all over India. The FLOWERS are also eaten as a vegetable; they are sold in the bazars of Bom-

The Common Yam.

Grierson (*Bihār Peasant Life*, 250) gives the following Bihār names for what appears several species of Yam, though by him placed under *D. sativa*:—*Latar*, north of the Ganges; *ratar* to the west; *atār*, north-west; *kathār*, south-west; in Patna and Gaya *ratālu*; in Tirhoot *phar*; and to the east *khamharna*. While regretting inability to arrange these names under their correct botanical synonyms, there seems no doubt they are names for yams, and it is interesting to have to add that Mr. Grierson furnishes the Bihār names for *Colocasia antiquorum* (the *kachchu*), as distinct from those above, which he says are yams.

References.—*Dals. & Gibs., Bomb. Fl. Supp.*, 92; *Stewart, Pb. Pl.*, 229; *Drury, Hand-book Fl. Ind.*, III., 274; *Year Book, Pharm.*, 1878, 275; *Beyl's Gujarat Agri.*, p. 53, appears to be describing three cultivated forms of this species; *Lisboa, U. Pl. Bomb.*, 178; *Birdwood, Bomb. Pr.*, 179; *Bomb. Manual, Rev. Accounts*, 101; *Gas. of Mysore and Coorg*, I., 55; *Smith, Dic.*, 444.

Habitat.—Cultivated over the greater part of India. Dr. Dymock, in a letter to the author, says there are several distinct varieties of this plant in Bombay. Lisboa remarks that it is "wild and cultivated in India and the Archipelago." Dalzell and Gibson state that it is "the most common species cultivated." Cultivated in Chutia Nagpur by the Santals.

Medicine.—In the form of a powder it is used as an external application for ulcers.

Food.—The TUBERS are eaten cooked as a common article of diet. In Bombay this is the most extensively cultivated species; of Gujarat it is said: "Three varieties of yam (*Ratālu*) are grown here, a long and a small white tuber—both called *dhola*, and a purple tuber, *lal*. They are alike generally raised on the ridges of ginger fields, irrigated and manured. Duration in the ground from seven weeks to two months." It is alluded to as cultivated in Rewa Kantha and Kathiawar. The "*ratālu*" is also said to be grown in Cawnpore, the seed for an acre being two maunds, and the produce 200 maunds. In the Hardoi Settlement Report (p. 16) it is stated that yam lands in the vicinity of towns fetch ₹50 an acre.

546

pea to about 3 inches in length. These tubers are also eaten but are chiefly used for seed. The species to which they belong appears to be *D. alata*, called in Tamil *Katsjal kelangu* or *Perum-vullic-kalangu*; in Hindustani *Kam*, in Telugu *Nilunu*. There are also several armed species in all forests in South India—notably *D. pentaphylla* and *D. triphylla*. These bear thin, long, underground tubers, which are very

DIOSPYROS
assimilis.

The Ebony-wood.

stringy or fibrous but contain a lot of starch. The Yam is available only for three months in the year, and is not depended upon in the Arcot district as food to any great extent."

From Bengal a note has been received to the effect that the hill tribes of Chittagong cultivate several forms of Yam. The whole plant is said to be eaten: no statistics are available however, either as to the cultivated plants or the extent to which wild yams are eaten. Of Chutia Nagpúr it is reported that a "*Dioscorea*—the *Byong-kullú*, or *Pichkú* of the Kóls—is found in the Singhbhum District. The Kóls of Saranda eat the underground tubers called *byong* after cooking them in fire. They depend to a considerable extent on this food. The people of Saitba also eat yams called *Kullú* and *Pichka* after being roasted."

DIOSPYROS, Linn.; Gen. Pl., 665.

The name *Diospyros* (celestial-fruit), was doubtless suggested for this genus of plants in allusion to the supposition that the fruit of *D. Lotus* may have been the oblivion-fruit of the ancients. The utmost difference of opinion, however, prevails as to the fruit which the heroes of the *Odyssey* ate, and perhaps DeCandolle is near the point when he says that, after all, Homer's *Lotus*-plant may have existed only in the fabled garden of the *Hesperides*.

The Sacred *Lotus* Flower, which plays so important a part in Oriental literature, is of course a water-lily and had nothing whatever to do with the *Lotus*-tree.

All the species of *DIOSPYROS* yield useful timbers, the best being the forms of *Ebony*. Gamble says of them collectively that all the species yield timber "with small pores, often in radial lines, and fine, very numerous, uniform and equidistant medullary rays, often closely packed. In most species there are numerous wavy, concentric lines across the rays. In several respects the structure of the ebonies resembles the structure of *SAPOTACEÆ*." The following enumeration of the better known species has been drawn up more on account of the timbers than the other economic facts attributed to them, and it has often been impossible to say more regarding even the wood than that it is used by the people and is viewed as good but inferior to certain other species. It is hoped, however, that the habitats will indicate the distribution of these useful trees, and that in future it may be possible to furnish definite information regarding each species (*Conf.* with the remarks under *D. Ebenum*).

Southern Konkan (Kánara) to Madras

Habitat.—A large tree of the Southern Konkan (Kánara) to Madras (Circars and Carnatic), Ceylon, and the Malaya. The utmost confusion exists in the writings of popular authors regarding this tree, it being generally assigned to Ceylon, and the Indian Ebony spoken of as the product of *D. melanoxydon* or of *D. Ebenaster*, thus implying that the true Ebony does not occur in India. By botanists *D. Ebenaster*, however, is viewed as a synonym for *D. Ebenum*. *Lisboa* (*Useful Plants of Bombay*) makes no mention of *D. Ebenum* or *Ebenaster* as occurring in

The Ebony-Woods

(G Watt)

DIOSPYROS
Ebenum.

the Bombay Presidency, and Dr Gray says it is a native of Ceylon. On the other hand, Mr. Talbot describes the plant as a forest tree in Kanara and adds that it is "one of the trees which are not allowed to

GUM

571sses of
treaksTIMBER.
572

Roxburgh says of Ebony "There are many species of this extensive genus, which yield a hard, black wood—I mean pure intensely black (not variegated), to all of which we give the general appellation Ebony my *D. melanoxydon* is one. The species I am now describing" (*D. Ebenaster, Willd.*) "a second, *Ebenus, Rumph, Amb, Vol 3, Pt I, t 1*, seems a third. From all these I know that of the Mauritius differs essentially by the entire fruit, with ripe seed, just received from that island, and now before me. The mountains of Bengal, Bhutan, and Nepal

573

TRADE.
574

occurs, "that given by *D. melanoxydon* in the Circar forests and *D. tomentosa* in those of the Deccan are more largely used, though but little is really exported, but the *D. melanoxydon*, *Roxb*—or Coromandel Ebony—is very largely used" (*Conf* with the account under *D. melanoxydon* on a further page)

The writer has failed to discover any report dealing comparatively with Indian, Ceylon, Mauritius, and other Ebonies. It would, for exam-

DIOSPYROS
Ebenum.
The Ebony-Woods.
TRADE.

there are five commercial Ebonies, and "of these the Mauritius wood is esteemed the best, and is probably the produce of the same tree as the Indian Ebony, *vis.*, *Diospyros Ebenum*. [This would not seem to be correct.—*Ed.*]. "The chief Indian and Ceylon Ebonies are *D. melanoxylon*, common in most provinces; *D. Ebenum*, of South India and Ceylon; *D. Kurzii*, the Andamanese Marble-wood, or *Teakah*, and *D. quæsita*, the Calamander wood of Ceylon. The price of Ebony in England is usually about £10 to £20 per ton, equivalent, at 50 cubic feet per ton, to four to eight shillings a cubic foot. The difficulty about Ebony is the small quantity of black heart-wood given by the common *D. melanoxylon*, and it is probable that the sale of whatever Ebony may be available will be better made at the Indian ports than in Europe. But the Andaman marble-wood should sell well if sent to Europe, and more especially as it can probably be obtained of larger size than ordinary Indian kinds" (*Vol. VII. (1881-82), p. 128*). The above, which is the only lengthy reference in the *Indian Forester* on the subject of Ebony, falls, as it seems to the writer, considerably short of the chief point to be aimed at in an effort to develop a trade in this valuable timber from India. It does not appear enough to say that the difficulty about Ebony is the small quantity of black heart-wood. It is necessary to know if this is a more adverse circumstance in India than in Ceylon and other ebony-producing countries. Unless it be contended that the produce of *D. melanoxylon* is commercially of equal value to that of *D. Ebenum*, that timber should be excluded from consideration, and the possibilities or otherwise of India becoming a source of true Ebony ought to be disposed of first, before the attempt is made to place on the market Ebony substitutes. Indeed, the various opinions recorded by authors regarding the Ebony from *D. melanoxylon* do not favour the idea that it is of equal value to that from *D. Ebenum*. This subject is worthy of consideration in its widest aspect. When it has been demonstrated that *D. Ebenum* produces an inferior or less remunerative Ebony in India than it does in other countries, it might then become desirable to foster the cultivation and trade in some of the other Ebony-yielding species. But until this has been demonstrated it would seem opposed to a possible trade in Indian Ebony to palm off all available black-woods as Ebonies. These may in themselves be good timbers for some purposes, even superior to Ebony, but success is more likely to follow an accurate declaration of their characters and properties than by taking advantage of commercial generalisations. But it cannot be stated that the timbers from Indian species of *Diospyros* have as yet been critically examined, and as Ebony is daily becoming more scarce in the European markets, it might be in the interests of this country to attempt the protection and possibly the cultivation of good species either indigenous to or found suitable for India.

It is scarcely necessary to mention here the numerous purposes to which Ebony is put. It is in great demand for ornamental turnery, for inlaying in fancy articles, cabinet-work, and for the keys in pianos, &c., &c. Gamble gives the weight of the Indian true Ebony as ranging from 61 to 70lb a cubic foot. Beddome regards it as considerably higher. He says: "*D. Ebenum* yields the best kind of Ebony, generally jet-black, but sometimes slightly streaked with yellow or brown; it is very heavy, close, and even-grained, and stands a high polish; unseasoned it weighs 90—100lb the cubic foot and 81lb when seasoned, and has a sp. gr. 1.296; it is used for inlaying and ornamental turnery, and sometimes for furniture, but there is not much demand for it in this presidency. The sap-wood is white, hard, close-grained and strong but not durable; at the same time it is used by the natives for various purposes. It is called *Nalluti* in Cuddapah and the *Karnúl* hill forests, where the tree is very

583

arid and dry zones in the Panjáb and Sind.* Distributed to Ceylon, Siam, and the Malayan Peninsula. Very abundant in Bengal. The Conservator of Forests, Northern Division, Bombay, states that in his division *D. Embryopteris* is not known. Wight's figures were made from specimens "found in Malabar." The Madras Board of Revenue, in a report furnished for this work, reports that, while the tree is known in some of the forests of the Presidency, especially the Northern Circars, it is not supposed to be used for tanning purposes or to pave the bottoms of boats.

Gum.—Considerable confusion exists on the subject of the gum or resin obtained from this tree. Cooke describes it as "dark brown, rather earthy looking, with a bright resinoid fracture, not unlike some light-coloured varieties of the black dammar. A similar specimen in the reference collection is a brown resin, with a shining fracture, externally coated with a greyish white or brownish crust. It is somewhat stalactitic as if it had trickled down the tree as it was exuded." Again: "The resin in the collection referred to this source was derived from Bhaugulpore; it is soluble in turpentine or benzole, forming a limpid varnish." Although many writers speak in general terms of a gum as obtained from this plant, they do so in such a manner as to suggest a possible confusion between a true gum and a prepared extract from the fruit. The writer cannot recollect having observed a gum exuding through the bark of *D. Embryopteris*, and neither Stewart, Brandis, Gamble, Beddome, nor Kurz mention a gum, though of course they all allude to the "viscid pulp, which is used as gum in book-binding, and in place of tar for paying the seams of fishing-boats. Its use for 'gabing' boats is general throughout the rivers of Lower Bengal and Assam. An infusion is used to render fishing-nets durable. It is full of tannin and is used in medicine as an astringent" (*Gamble*). Dymock writes: "The extract of the fruit is of the colour and consistence of shell-lac." An extract is thus prepared in some parts of the country which might, as in the case of Cutch, closely resemble a resin. It thus may be the case that the passage quoted above from Dr. Cooke's Report on Gums and Gum-resins, &c., refers to the extract, but what seems more likely the case, it is the description of a true gum but not a product from *D. Embryopteris*. Some time ago information was called for by the Department of Public Works on the subject of gums and the replies obtained from every Province were in 1871 printed in the form of a combined report. From nearly every district of India some mention was made of the substance now under consideration, but in no instance was the tree stated to yield a gum. Of Assam it was stated: "The *Kendú* tree fruit yields a resinous gum: it is used for caulking the small canoes. The Dome fishermen colour their nets with it, and thereby render them more durable in wear and tear." So again the Commissioner of Dacca wrote: "There is no resinous product which is extensively used except the preparation of the *Gáb* tree." The Commissioner of the Presidency Division, Bengal, stated that "A decoction of the unripe *gáb* fruits is used for caulking boats." The above passages are representative of the whole series of replies. No mention is made of a gum but the use of the decoction, extract, or fresh pulp of the unripe fruit is general, at least over the Lower Provinces. Mr. Baden Powell, in a review of Dr. Cooke's report on Gums (*Indian Forester*, II., 179), after discussing the properties of the viscid pulp, adds: "If the fruit is meant in the text, we have neither gum nor resin properly so called to deal with. Forest Officers and others who have the opportunity of studying *D. Embryopteris* would render a valuable service by looking up the matter of gum or no gum, and thus remove a perplexing

dried fruits are somewhat tough and consequently difficult if not impossible to grind. An extract should be prepared in India if the attempt be thought desirable to introduce the tan to European commerce.

For further chemical analysis and percentage of tannic acid, see concluding sentences of the paragraph below on the Medicinal properties of *gab* fruit.

Oil.—An oil, extracted from the seed by boiling, is used in native medicine.

Medicine.—The **FRUIT** and the **BARK** both possess astringent properties. The **JUICE** of the unripe fruit makes a good application to fresh wounds. It is rich in tannin, and is therefore a useful domestic astringent, and the tree is so plentiful as to be at the door of even the poorest cotter. An **OIL** extracted from the seeds is also employed in native medicine. It is used in dysentery and diarrhoea with success. The infusion of the fruit is given as a gargle in aphthæ and sorethroat (*Kani Lal De Bahadur*). Dr. Dymock gives the following brief history of the medicinal uses of *gab*: "The circumstance that the unripe fruit abounds in an astringent viscid juice, which is used by the natives of India for daubing the bottoms of boats, was communicated by Sir William Jones to Roxburgh in 1791. The introduction of the fruit into European practice in India is due to O'Shaughnessy. In 1868 it was made official in the *Pharmacopœia of India*. In Bombay the fruit is eaten by the poorer classes. The **SEEDS** are preserved by the country people and given as an astringent in diarrhoea. The testa is the astringent part, the albumen being almost tasteless." Ainslie, speaking of the fruit, says: "On being punctured, it gives out a juice of peculiar astringency, and which the Hindú doctors sometimes employ as an application to fresh wounds." The *Pharmacopœia* recommends the drug to be exhibited in the form of an extract prepared from the expressed juice over a water-bath. It is "of a reddish brown colour, in flexible plates, and readily soluble in water. It is an excellent astringent and very useful in diarrhoea and chronic dysentery. A solution of two drachms in a pint of water is a valuable vaginal injection in leucorrhœa." In a further page the *Pharmacopœia* explains that the reputed value of this drug rests mainly on the testimony of Sir W. O'Shaughnessy, but it adds: "There is little doubt that it possesses powerful astringent properties, and is deserving of a high place amongst indigenous remedies of this class." Dr. Dymock points out that the *Diospyros* fruit is intensely astringent until quite ripe, when it suddenly becomes mawkish and sweet without a trace of its former astringency. This is noticed in the 'Pharmacographia,' but not in the Indian *Pharmacopœia*, where unripe fruit should have been ordered." This fact is of very considerable importance and must account for the varying percentage of tannin found in the fruits by different chemists. O'Shaughnessy is said to have found 60 per cent.; Professor Hummel (see paragraph on **Dye and Tan** above) found only 15 per cent. It would be most instructive to have the fruits in all stages of their growth chemically analysed, since it would seem that both as a drug and a tan opinions founded on imperfect materials have become current in the literature of this subject.

SPECIAL OPINIONS.—§ "According to O'Shaughnessy the juice of the unripe fruits contains 60 per cent. of tannic acid. The bark has been used with doubtful results in the treatment of intermittent fevers" (*Dr. Warden, Prof. Chemistry, Calcutta*). "The expressed juice abounds in tannin and is used in cases of diarrhoea, dysentery, and hæmorrhage from internal organs" (*Civil Surgeon J. H. Thornton, B.A., M.B., Monghyr*). "The pulp of the ripe fruit is sweet and astringent in flavour, and may be moderately used in ordinary cases of diarrhoea and dysentery" (*Civil Surgeon Bankabehary Gupta, Pooree*).

FOOD.

Fruit.

602

Dye.—In Japan black dyes are produced from the fruit of this tree with sulphate of iron.

Food.—Cultivated on account of its FRUIT which is about the size of a small apple, the better qualities being described as delicious and often made into preserves. Roxburgh says: "The fruit is tolerably pleasant, though by no means equal to a good apple, but what is worse, the trees about Calcutta are uncommonly unproductive." Balfour writes that the fruit in Japan and China "attains the size of an orange, and is frequently sent to Europe in a dried state. Preserved in sugar, it is a large thin-skinned, juicy fruit of an orange yellow colour, with a sweet taste."

Habitat.—A large evergreen tree of the Andaman and Nicobar Islands.

TIMBER.

604

Structure of the Wood.—Handsome, streaked with black and grey; the grey wood hard; the black wood very hard, with alternate streaks of black ebony and grey. The mass of ebony occupying the centre of the tree is large and very irregular in outline, and frequently encloses interrupted concentric belts of light-coloured wood. At the Conference on Indian Timbers held in the Commercial Rooms of the Colonial and Indian Exhibition, Sir D. Brandis explained the properties of this timber. To the question as to the sizes of logs available, he replied that planks of 12 to 15 inches would, in his opinion, be the maximum. The gentlemen present at the conference thought that if the supply were regular a good demand for the wood might be expected. Pieces of furniture made of it were exhibited, which seemed to justify the idea that it might come into use for fancy cabinet-making.

Furniture.

605

In India it is sparingly employed for furniture, but a considerable demand exists for walking sticks made of this wood. It seems to deserve to be better known as a substitute for the Ceylon Calamander wood, which it resembles in appearance very much. It is said by Major Ford to be used in the Andamans for handles and sheaths of blades, and for furniture. Home's survey gave 224 trees, or one tree per acre; so that it is fairly abundant.

Nagpur, 1885, 6, 32; *Gasetteers*, Bombay (Panch Mahals), III., 201; VII., 31, 32, 36; XI., 25 and 404; XIII., 27; XV., Pt. I., 67; XXV., 92, 164, 348, and 389.

Habitat.—A large tree, attaining a height of 60 to 80 feet, sometimes seen as a shrub. Roxburgh mentions it as a native of "most woody mountainous countries in India, viz., Ceylon, Malabar, Coromandel, Orissa, &c." It is said not to be met with in Burma (*Kurs*, Brandis). It seems probable that this species should be described as the Western representative, just as *D. tomentosa* might be said to be the Eastern and Northern Indian form. The *Flora of British India* retains these Roxburghian species as distinct, but many Indian authors view them only as forms of one and the same species. Lisboa says of *D. melanoxylo* that it "is not uncommon in Bombay, North Kánara, and the Madras forests, extending northwards as far as the Ravi. It attains a height of 30 to 50 feet, sheds its foliage in the cold season, renews and flowers in the hot season, and ripens its fruits during the rains." The plant met with in the Ravi basin is most probably *D. tomentosa* not *D. melanoxylo*. According to Wight the latter plant is met with on the Nilghiris and Serramalli hills near Dindigul. The Madras Board of Revenue assign it, however, to the Eastern Gháts and hills of Kurnool, so far as the Madras Presidency is concerned. It is also said to be very common in Thana in Bombay. A recent report furnished by the Forest Department of Bengal speaks of it as found in Singbhoom. It attains a girth of about 6 feet. The timber might be obtained from Madras.

Var. Beddomei—*D. exsculpta*, Bedd. (not Ham.). Some doubt exists regarding this plant. The description of it given in the *Fl. Br. Ind.* is based on Beddome's plate (*Fl. Syl.*, 66). Beddome remarks that it is found in the Cuddapah, Salem, and Karnul forests, and probably elsewhere in the Madras Presidency. He adds that it is found also in Bengal and Bombay, but this last statement most probably rests on the identification of the Madras variety with *D. exsculpta*, Ham., a synonym for *D. tomentosa*, Roxb.

Gum.—Like *D. Embryopteris*, this species is reported to yield a gum, but nothing of a definite nature can be discovered regarding that gum and its existence may be doubted. Indeed, in the writer's opinion, it is highly

616

GUM.
617

The Coromandel Ebony.

(G Watt)

DIOSPYROS
melanoxylon.

doubtful if any *Diospyros* yields a gum or resin, though the fruits of all would most probably afford a resinoid juice.

Medicine—The BARK possesses astringent properties, and is used in decoction in diarrhoea and dyspepsia as a tonic. In a dilute form it is used as an astringent lotion for the eyes. Roxburgh says that the bark, powdered and mixed with pepper, is given for dysentery.

Food—The tree flowers in April and May, and produces a FRUIT which, when ripe, is eaten by the natives. It seems probable that the fruit of this tree is often confused with that of *D. tomentosa*. Roxburgh's description of these two fruits may be here given. *D. melanoxylon* berry round, of the size of a small apple, yellow, pulpy, seeds as many as 8, immersed in the pulp, kidney-shaped, sharp on the inner edge. *D. tomentosa*: berry ovate, as large as a pigeon's egg, covered with a smooth hard bark, which becomes yellow when ripe, and is filled with a soft, yellow edible pulp. The fruit of *D. melanoxylon* by some writers is said to have an astringent taste, not palatable. But by others "The fruit when perfectly ripe has a pleasant taste and is much liked" (*Kanara*) "The fruit is of the size of a plum." It is "gathered chiefly by the Nair-

References.—*Ralfour*, *Cyclop.*, 954; *Bombay Gasetteer* (Kánara), XV., I., 437; *Beddome*, *Jc. Pl.*, pl. 133.

Habitat.—"A large tree" (*Flora Br. Ind.*); "an immense evergreen tree, very common in North Kánara" (*Talbot*). *Beddome* and several other writers allude to this box-wood-like-leaved species as met with in Mysore, the Anamallay hills, and as being distributed to Malacca, Java, and Borneo. *Beddome* says it is "very common in South Kánara forests of the Gháts and plains." It flowers in the cold season.

624

D. mollis, *Griff.*; in *Jour. Agri.-Hort. Soc.*, III., 145; *Kurz*, *For. Fl. Burm.*, II., 130.

This plant is not alluded to in the *Flora of British India*, unless it be *D. martabanica*, *Clarke*, under which is given as a synonym *Gunisanthus mollis*, *Kurz*. Turning to *Kurz*'s paper in the *Journal of the Asiatic Society of Bengal*, where he first described the plant, he is found to state that *D. mollis*, *Kurz* MS., is a synonym for *Gunisanthus mollis*, *Kurz*; but in his later publication (*For. Fl. Burma*, II., 126), he gives *G. mollis*, *Kurz*, as a distinct plant from *D. mollis*, *Griff.* Under the last mentioned name he says—"The berries produce the so-called black dye of the Shans." *Mason* mentions the same fact, and states that the tree grows on the mountains which separate the province of Tavoy from the Siamese territory. He calls it the *ma-kleu*. This same economic fact has been subsequently reproduced by various writers, none of whom have apparently identified the plant. Thus *Colquhoun* (*Among the Shans*) mentions this plant as yielding a black dye. *Balfour*, *Liotard*, and others describe it as the "celebrated vegetable black dye."

BLACK DYE.
625

It would be interesting to have this matter cleared up by original investigation. Are there, for example, two trees, *vis.*, *Gunisanthus mollis*, *Kurz*, and *Diospyros mollis*, *Griff.* (as in *Kurz*, *For. Fl.*); if not, are both these synonyms for *D. martabanica*, *Clarke* (as in the *Flora of British India*)? The dye obtained is so highly spoken of, that this subject would seem to call for early investigation. Black dyes are reported to be obtained from the shoe-flower (*Hibiscus rosa-sinensis*), from the juice of the cashew tree (*Anacardium occidentale*), from the fruit of various species of *Melastoma* (hence the name, because of the fruits staining the mouth black), and from this imperfectly known *Diospyros*—the Shan black-dye. In his report on Pegu *Kurz* says the wood of *Gunisanthus mollis* is of a red brown colour, rather heavy, has a short fibre, is close-grained and soft. It is soon attacked by xylophages.

stated that "The fruit is eaten and much relished by the forest tribes, but is seldom offered for sale in the market;" "except in the size of its fruit, which is as large as an apple, it is scarcely distinguishable from *D. melanoxylon*, *tamrug*, whose fruit is of the size of a plum." On the other hand, Mr. J. C. Lisboa (*Useful Plants of Bombay*, page 93) describes *D. montana*, Roxb. (giving "*D. Goindu*, *Dals*," as a synonym), and states that the "fruit is bitter, not eaten." At page 164 he gives an account of "*D. Goindu*, *Dals*," (placing *D. montana*, Roxb., under it as a synonym), and remarks that "The fruit globose, size of large cherry, yellow when ripe, is said by Dr. Birdwood to be eaten as a fruit." In the *Ahmednagar Gasetteer* it is stated that the *Gondhan* (*D. cordifolia*) bears an edible fruit. Of the Panjáb, Stewart writes: "The fruit is not eaten, and I have heard it called 'poisonous.'" This confusion may perhaps be accounted for by the amalgamation of *D. montana* and *D. cordifolia* into one species.

Fodder.—"Leaves used as fodder in Oudh" (Brandis).

Structure of the Wood.—Yellowish-gray, soft, no heartwood, no annual rings. It is durable and would be good for furniture.

"The wood is used for making carts (*Panch Mahál Gaz.*, 201). Dr. Hove (a Polish botanist who visited Gujarat in 1787) describes a forest of "black-wood" and the process adopted for darkening the timber. Modern writers are disposed to regard the "black-wood" described by Hove as having been *D. montana* and not *Dalbergia latifolia*. Hove states that the wood was buried in a swamp, and after soaking till it was black was sent for sale to Surat and other places on the coast (*Conf.* with *Dalbergia latifolia*, p. 9). "A small tree of the ebony kind with black and variegated streaks towards the heart. The wood is pretty strong but is not much used" (*Kánara Gaz.*, 67). "Wood is dark-brown, mottled with white, hard, close-grained, takes a fine polish, and is used for furniture" (*Lisboa*). In Kolába it is said to be used in hut and cowshed building. "It has a very hard strong wood, but, except for cart poles, is not much used. The fact that it is not durable, that it suffers from the attacks of insects and cannot be crested, takes away from the value of its timber. The centre or heartwood, which is very small, is ebony of an inferior kind; but except that it is turned into wooden bracelets, it is apparently not known in trade" (*Bombay Gaz.*, XXV., 389). In Ahmednagar it is said that the wood of this species is good fuel, and that it is used chiefly for making field and other tools. Balfour affirms that the tree is not uncommon along the Siwalik tract up to near the Ravi, and occasionally out in the plains westward from near Delhi to Sirsa. The wood, dark and strong, is fitted for agricultural implements, in door work, &c.; does not bear exposure, and could not be creosoted.

Diospyros nigricans, Wall.; *Fl. Br. Ind.*, III., 557.

References.—[Beddome, *For. Man.*, 144, so quoted in *Fl. Br. Ind.*, seems to the writer to be the description of the plate 124, *fc. Pl. Ind. Or.* (*D. NIGRICANS*, *Dals*.), that description being simply reprinted in the *Icones*. Beddome probably never saw *D. NIGRICANS*, Wall., a Khásia Hill plant, so that his plate and description appear to refer to the Konkan species, *D. ASSIMILIS*, Bedd.]

Habitat.—A tree attaining a height of 50 feet, met with in the Khásia Hills and Sylhet.

Structure of the Wood.—Nothing is known as to the special properties of the timber of this tree. It doubtless possesses the characteristic features of the other species, but it is alluded to in this place chiefly with the view of correcting a mistake current in Indian botanical works, and

This would appear to be the eastern and northern representative of D

Medicine—**RASPINGS** of the wood are officinal in the Panjáb, being given as an alterative (*Stewart*)

Food.—When ripe the BERRIES are yellowish, and are filled with a soft yellow, sweetish, astringent pulp, eaten by the natives. (Conf. with *D. melanoxyylon*.) Stewart, who in all probability is correctly alluding to this species, since *D. melanoxyylon* does not occur in the Panjāb, says the FRUIT, which is reported to ripen in June with the mango, is eaten, being sweetish and astringent and not unpleasant. But one authority reports its pulp as bitter, foetid, and emetic.

Structure of the Wood.—Roxburgh says it is like the wood of *Olea* and is in short the ebony of Bengal. This plant is scarce, but that the wood brittle. It carves well, and insects at Madhopur workshops, informs me it though hardly so strong as *Olea*. In that tract, where the tree is more common boxes, &c., are constructed of the wood. Ambala District. In Kanara it is used for small boxes and for small boxes white, but that of oil hard, but somewhat for the wood-work of their houses.

in India, the name of Garjan oil, but this point has not been satisfactorily determined, and it seems likely that the Garjan oil of European and Indian commerce may in reality be any one or a mixture of all the *Kanyin* and *in* oils but chiefly of the former. For particulars as to the extraction of *Kanyin*-oil see a further page under *D turbinatus*

D 677

DIPTEROCARPUS

lævis.

The Garjan Oil Trees.

TIMBER.
678

Structure of the Wood.—Sapwood white; heartwood reddish-grey, moderately hard, smooth, mottled, takes a fine polish. Weight from 38 to 50 lb a cubic foot. Used for house-building and canoes, but is not durable; if exposed to wet it decays rapidly, the canoes made of it lasting only three to four years.

679

Dipterocarpus angustifolius, *W. & A.*; *Fl. Br. Ind.*, I., 299.

Syn.—DIPTEROCARPUS COSTATUS, *Roxb.* (not of *Gærtn. f.*).

According to *Roxburgh* this species is a native of Chittagong. By the *Flora of British India* it is viewed as doubtfully distinct.

680

D. Griffithii, *Miq.*; *Fl. Br. Ind.*, I., 299.

Syn.—DIPTEROCARPUS GRANDIFLORUS, *Griff.* (not of *Wall.*).

References.—*Kurz, For. Fl. Burm.*, I., 116; *Report on Gums and Resins issued by P. W. D.*, pp. 34, 62, 64.

Habitat.—A tree of the Mergui and South Andaman Islands. *Kurz* says it is common in the tropical and moister upper mixed forests of the Andamans and also in Tenasserim.

TIMBER.
681

Structure of the Wood.—Yellowish-grey, rather coarsely fibrous, close-grained, and heavy (*Kurz*).

682

D. incanus, *Roxb.*; *Fl. Br. Ind.*, I., 298.

References.—*Roxb., Fl. Ind.*, Ed. C.B.C., 439; *O'Shaughnessy, Beng. Dispens.*, 224; *Dymock, Mat. Med. W. Ind.*, 2nd Ed., 88; *Report on Gums and Resins issued by the P. W. D.*, pp. 19, 20, 31, 35, 37; *Cooke, Gums and Gum-resins*, 114; *Agri-Hort. Soc. of India Journ.*, Vol. IV., 15; *Spons' Encyclop.*, 1651; *Balfour, Cyclop.*, 956, 1087.

Habitat.—A tree of Chittagong (*Roxburgh*), but according to *Kurz* it occurs also in Pegu.

OLEO-RESIN,
Wood-oil.

683

Oleo-resin.—It yields a WOOD-OIL or balsam. *Roxburgh* says this is the *garjun* tree of Chittagong "where the tree grows to a great size and is said to furnish the largest proportion of the best sort of wood-oil or balsam mentioned in my description of *D. turbinatus*. Flowering time November and December, and the seed ripens in April." *Balfour* seems to be mistaken when, after enumerating *Dipterocarpus alatus*, *D. costatus*, *D. incanus*, *D. lævis*, and *D. turbinatus* as yielding wood-oil, he adds "but *D. incanus* is supposed to yield the best sort and in the greatest quantity."

MEDICINE.
oil.

684

Medicine.—*Dymock* also includes this plant along with *D. turbinatus* and *D. alatus* in his account of the medicinal Gurjun-oil, but it is certainly far less important commercially than Kanyin-oil-yielding trees of Burma.

D. indicus, *Beddome*; see under *D. lævis*, *Ham.*

685

D. lævis, *Ham.*; *Indian Forester*, X., iii., 131; IX., 216.

The lofty tree so named—a native of the tropical forests of Burma—is, by the *Flora of British India*, reduced to be a synonym for *D. turbinatus*, *Gærtn. f.* It has been the custom followed by the writer to accept the *Flora* as the standard on all botanical points, the endeavour being made in the present work to compile the economic information regarding plants under the names as established by *Sir J. D. Hooker*. *Gamble*, *Kurz*, and other Indian botanists do not, however, accept the above reduction as correct, but prefer to regard these names as belonging to distinct trees. Should this latter opinion be confirmed, the information given under *D. turbinatus* would probably, to some extent, have to be rearranged. *Gamble*, however, affirms that the Garjan-oil tree is *D. turbinatus*, although under

D. 685

The Male In or Inbo Tree. (G Watt) *DIPTEROCARPUS pilosus*.

D. laevis he makes the remark that "it yields copiously a resin and a wood-oil used for garjan and wood-oil trees. If this be so,

what has been given mention in this place the Burmese name given to *D. laevis*, *Ham, vis, Kanyin ni* (e.g., red *Kanyin*), while *D. alatus* is known as *Kanyin-byu* (e.g., white *Kanyin*). Gamble points out that, according to the *Flora of British India*, *D. indicus*, *Beddome, t 94*, may be reduced either to *D. turbinatus* or *D. laevis*. He appears, however, to view it as a distinct species, a native of the western Ghats, which is there known as *Guga* and *Walivara* in Kánarese. The Garjan oil reported to be made in South India would, accordingly, be the produce of *D. indicus*.

Resin—The authors who recognise this as a distinct species say that it yields a resin similar to that of all the other species.

Oil—For information as to the wood oil obtained from this plant, see under *D. turbinatus*.

Structure of the Wood—Sapwood white, heartwood rough, reddish, soft, is rarely used, but is occasionally employed for planking and rafters, weight 43—49 lb a cubic foot.

Habitat—A large evergreen tree met with in Assam, Chittagong, Pegu, Arracan, hills of Martaban and Tenasserim, and also the Andaman Islands. Distributed to Sumatra.

Oilco-resin—Mr Oliver, in the report below and accompanying correspondence, suggests that perhaps some of the Kanyin oil of Tenasserim may be obtained from this tree.

Structure of the Wood—"Of a reddish-brown colour, close and pretty straight grain, it does not warp or split much but quickly deteriorates unless kept timber in use.

except for business, as not less than 400,000 boxes for packing tea are used yearly, the making of each one requiring about 150 cubic feet of rough timber" (*Paganius, in Indian Forester*)

DIPTEROCARPUS

lævis.

The Garjan Oil Trees.

TIMBER.
678

Structure of the Wood.—Sapwood white; heartwood reddish-grey, moderately hard, smooth, mottled, takes a fine polish. Weight from 38 to 50lb a cubic foot. Used for house-building and canoes, but is not durable; if exposed to wet it decays rapidly, the canoes made of it lasting only three to four years.

679

Dipterocarpus angustifolius, *W. & A. ; Fl. Br. Ind., I., 299.*

Syn.—DIPTEROCARPUS COSTATUS, *Roxb. (not of Gærtn. f.).*

According to Roxburgh this species is a native of Chittagong. By the *Flora of British India* it is viewed as doubtfully distinct.

680

D. Griffithii, *Miq. ; Fl. Br. Ind., I., 299.*

Syn.—DIPTEROCARPUS GRANDIFLORUS, *Griff. (not of Wall),*

References.—*Kurz, For. Fl. Burm., I., 116; Report on Gums and Resins issued by P. W. D., pp. 34, 62, 64.*

Habitat.—A tree of the Mergui and South Andaman Islands. *Kurz* says it is common in the tropical and moister upper mixed forests of the Andamans and also in Tenasserim.

TIMBER.
681

Structure of the Wood.—Yellowish-grey, rather coarsely fibrous, close-grained, and heavy (*Kurz*).

682

D. incanus, *Roxb. ; Fl. Br. Ind., I., 298.*

References.—*Roxb., Fl. Ind., Ed. C.B.C., 439; O'Shaughnessy, Beng. Dispens., 224; Dymock, Mat. Med. W. Ind., 2nd Ed., 88; Report on Gums and Resins issued by the P. W. D., pp. 19, 20, 31, 35, 37; Cooke, Gums and Gum-resins, 114; Agri-Hort. Soc. of India Journ., Vol. IV., 15; Spons' Encyclop., 1651; Balfour, Cyclop., 956, 1087.*

Habitat.—A tree of Chittagong (*Roxburgh*), but according to *Kurz* it occurs also in Pegu.

OLEO-RESIN.
Wood-oil.

683

Oleo-resin.—It yields a wood-oil or balsam. *Roxburgh* says this is the *garjun* tree of Chittagong “where the tree grows to a great size and is said to furnish the largest proportion of the best sort of wood-oil or balsam mentioned in my description of *D. turbinatus*. Flowering time November and December, and the seed ripens in April.” *Balfour* seems to be mistaken when, after enumerating *Dipterocarpus alatus*, *D. costatus*, *D. incanus*, *D. lævis*, and *D. turbinatus* as yielding wood-oil, he adds “but *D. incanus* is supposed to yield the best sort and in the greatest quantity.”

MEDICINE.
Oil.

684

Medicine.—*Dymock* also includes this plant along with *D. turbinatus* and *D. alatus* in his account of the medicinal *Gurjun*-oil, but it is certainly far less important commercially than *Kanyin*-oil-yielding trees of Burma.

D. indicus, *Beddome*; see under *D. lævis*, *Ham.*

685

D. lævis, *Ham. ; Indian Forester, X., iii., 131 ; IX., 216.*

The lofty tree so named—a native of the tropical forests of Burma—is, by the *Flora of British India*, reduced to be a synonym for *D. turbinatus*, *Gærtn. f.* It has been the custom followed by the writer to accept the *Flora* as the standard on all botanical points, the endeavour being made in the present work to compile the economic information regarding plants under the names as established by *Sir J. D. Hooker*. *Gamble*, *Kurz*, and other Indian botanists do not, however, accept the above reduction as correct, but prefer to regard these names as belonging to distinct trees. Should this latter opinion be confirmed, the information given under *D. turbinatus* would probably, to some extent, have to be rearranged. *Gamble*, however, affirms that the *Garjan*-oil tree is *D. turbinatus*, although under

D. 685

The Male In or Inho Tree 5 Tall *Dipterocarpus pilosus*

D. lavis he makes the remark that "it will burn as a first and a wood-oil used for painting." According to some of the natives, the garjan and wood-oil are distinct, though both are obtained from several trees. If this be so, a rearrangement will probably not seriously affect what has been given below. I may serve a useful purpose, however, in mentioning in this place the Burmese name given to *D. lavis*, *Kanyin ni* (e.g., red Kanyin), while *D. albus* is known as *Kanyin ni* (e.g., white Kanyin). Gamble doubts the correctness of the name *D. lavis* in British India, *D. indicus*, *D. turbinatus*, &c., may be taken from it. *D. turbinatus* or *D. lavis*. He agrees, however, to say it is a distinct species a native of the western Ghats, where it is known as *Kanyin ni* and *Kanyin ni* is known. The Chinese name is *D. indicus* in India would accord with the name of *D. indicus*.

Resin.—The authors who describe this as a distinct species say that it yields a resin similar to that of all the other species.

Oil.—For information as to the value of the oil, see the table under *D. turbinatus*.

Structure of the Wood.—Seasoned wood, heart of wood, heart soft, is rarely used, but is occasionally employed in building and other weight 43—49 lb a cubic foot.

***Dipterocarpus obtusifolius*, Tr. ex. Fl. Br. Ind., L. 272**

This is in Burma called the *Ma In* tree or *Ma In*.

Vern.—*Inho*, *Kanyin ni* according to Gamble's book.

References.—Kurz, *Fl. Burm. Ind.*, v, *Gamb.*, *Ind. Trees*, 23 *Indian Forester*, VIII, etc.

Habitat.—A large, deciduous tree of the *In* or *Ma In* of Burma and Martaban, ascending to 300 ft. It is common in some of the small patches in the *In* forests.

Resin.—This tree is said to yield a resin of value, but is not reported to burn as a resin, but is not used for any purpose.

Structure of the Wood.—Heart of wood, heart soft, is rarely used, but is occasionally employed in building and other weight 43—49 lb a cubic foot. (Gamble) Kurz says it is "of the quality of first of *D. lavis*."

Habitat.—A large, evergreen tree of the *In* or *Ma In* of Burma and Pegu Arracan, hills of Malacca, etc. It is common in some of the small patches in the *In* forests.

Oil-resin.—Mr. D. says it is a resin of value, but is not reported to burn as a resin, but is not used for any purpose.

Structure of the Wood.—Heart of wood, heart soft, is rarely used, but is occasionally employed in building and other weight 43—49 lb a cubic foot. (Gamble) Kurz says it is "of the quality of first of *D. lavis*."

2) 4/5

DIPTEROCARPUS
turbinatus.

The Garjan or Kanyin Oil.

References.—*Roxb., Fl. Ind., Ed. C.B.C., 439; Kurz, For. Fl. Burm., I., 114, 115; Gamble, Man. Timb., 31, 32; Mason's Burm. & Its People, pp. 493, 516, 527, 757; Hooker, Him. Cor., 225, 230, 232, 290; Trans. Agri.-Hort. Soc., VIII., 345; Jour. Agri.-Hort. Soc., Vol. IV., 14.*

Habitat.—An evergreen tree of Eastern Bengal, Chittagong, Burma, and (according to Gamble) of the Andaman Islands. Distributed to Singapore.

It is said to be one of the loftiest of Indian trees, individual specimens being sometimes seen 250 feet in height, but *D. lævis* is generally reported to be the higher form, *D. turbinatus* rarely exceeding 200 feet. Hooker, referring to *D. turbinatus* in his account of Chittagong, says: "This is the most superb tree we met with in the Indian forests; we saw several species, but this is the only common one here; it is conspicuous for its gigantic size, and for the straightness and graceful form of its tall unbranched pale grey trunk, and small, symmetrical crown: many individuals were upwards of 200 feet high, and 15 in girth."

OLEO-RESIN.

Oleo-resin.—Considerable confusion exists in the literature of Garjan and Wood-oil. Apparently several species of *Dipterocarpus* yield balsamic products to which it would seem the name *garjan* oil is assigned. In Burma one set of oils is, however, collectively spoken of as *Kanyin*-oils, another as *In*-oils. The term *garjan* appears to be unknown to the Burmans.

A reference having been made by the Revenue and Agricultural Department to the Government of Burma for particulars, to be inserted in the present publication, as to the "various species of *Dipterocarpus* that yield wood-oil (*garjan*)," the following instructive reply was obtained: The passage here quoted is in continuation of that given above under *D. tuberculatus*:—"Kanyin oil is the produce of *D. lævis* (*Kanyin-in* = Red *Kanyin*) and *D. alatus* (*Kanyin-byu* = White *Kanyin*) which are common in evergreen forests, and probably of other species of similar habitat. The oil is generally collected only in the dry weather (November to May). It is obtained by cutting two or three deep pyramidal hollows (the apex pointing towards the interior of the stem) near the foot of the tree and by applying fire to the upper cut surfaces. The oil then collects at the bottom of the hollow, which is emptied every three or four days. Fire is applied every time the oil is removed, and the upper surfaces of the hollow are rechipped three or four times during the season. In Tharrawaddy district, where trees are not very plentiful, twenty are about as many as one man can attend to. The yield of twenty trees would be about 100 viss for the season, worth Rs25. In Prome district oil only comes into the market in the form of torches, which are made of rotten wood steeped in oil and rolled up in *Salu* leaves (*Licuala peltata*). The exports of Kanyin oil from Burma ports during 1887-88 were as follows:—

				R
Rangoon .	18,826 gallons valued	.	.	16,302
Moulmein .	782 " "	.	.	575
Mergui .	55,470 viss "	.	.	9,394

tus; the former being a much loftier tree than the latter. Kurz mainly distinguishes these plants by the former being glabrous, while the latter is hairy.

Varieties of Garjan Oil.—The writer can discover no author who has separately distinguished the oleo-resins described above; indeed, in all the published accounts, which he has been able to consult, the substance described appears to be that obtained after charring the trees—the Kanyin oils. Thus Roxburgh wrote of *D. turbinatus* that "To procure the balsam a large notch is cut into the trunk of the tree, near the earth (say, about thirty inches from the ground), where a fire is kept up until the wound is charred, soon after which the liquid begins to ooze out. A small gutter is cut in the wood to conduct the liquid into a vessel placed to receive it. The average produce of the best trees during the season is said to be sometimes forty gallons. It is found necessary, every three or four weeks, to cut off the old charred surface, and burn it afresh; in large healthy trees abounding in balsam, they even cut a second notch in some other part of the tree, and char it as the first. These operations are performed during the months of November, December, January, and February. Should any of the trees appear sickly the following season, one or two more years' respite is given them." Lieut. Hawkes published, in his report on the Oils shown at the Madras Exhibition of 1855, an account of the extraction of this oil by charring, the operation being performed in "March or April." But Lieut. Hawkes was apparently, like Roxburgh, ignorant of the oil extracted from *D. tuberculatus* with or without the aid of fire. Sir J. D. Hooker (*Him. Journals, Vol. II., 348*) gives a brief note regarding the oleo-resin obtained in Chittagong from *D. turbinatus*. He says: "A fragrant oil exudes from the trunk, which is extremely valuable as pitch and varnish, &c., besides being a good medicine. The natives procure it by cutting transverse holes in the trunk, pointing downwards, and lighting fires in them, which causes the oil to flow." Mason, than whom few more trustworthy authors on Burmese subjects could be found, attributes wood-oil to *D. lævis* and *D. turbinatus*, but says of *D. grandiflora* (a synonym for *D. tuberculatus*) that "the gum of this species, as well as that of the preceding, is used by the natives to make torches." It is, however, significant that Mason should not have described the process of extraction of his "wood-oil" or of the "gum," nor even mentioned the seasons at which these products are obtained. Dr. Cooke, in his report on the Gums, Resins, and Oleo-resins of India, quotes Roxburgh's description of the process of extraction, and reviews the opinions advanced by Lieut. Hawkes under *D. turbinatus*, *Gærtn. f.*; but under *D. tuberculatus*, *Roxb.*, he simply remarks: "A wood-oil, under the name of *Eng*, is said to be the produce of *D. tuberculatus*; this was sent to London from Burma (May 1874) for valuation and report." Flückiger and Hanbury (in their *Pharmacographia*) follow the same course, but seem not to have heard of an oil extracted without the aid of fire, such as the thick oleo-resin known in Burma as *In-oil*.

In a further paragraph will be found the opinions of medical writers regarding Garjan oil, in which it is held that there are different qualities, some of very considerably higher medicinal merit than others. This fact would point to the desirability of a thorough investigation into the oleo-resins obtained from all the species of *Dipterocarpus* in which the chemical properties and industrial merits of each should be separately established. With this in view experiments might be conducted in order to ascertain if *D. tuberculatus* is the only species that affords the oil on being simply tapped, or whether *D. turbinatus* and *D. lævis* might not also do so, and lastly what action or influence the charring process exercises. It

seems probable that, assuming that the oleo-resins from all the species of *Dipterocarpus* are chemically identical, that obtained during a different season of the year, and by a different process may be distinct or have its

CHEMISTRY.
708

this oil is the fact that it is reported to act as a solvent to caoutchouc. This was apparently discovered at the beginning of the present century by Mr. Laidlay, and his experiments will be found in the *Transactions*

This fact appears to have been practically lost sight of, while it might prove the key to an industrial utilisation of the substance, since such water-proofings would, from the property of the *garjan* oil, be at least proof against the attacks of insects, if they were not found in addition to possess other useful properties.

A sample of *garjan* oil obtained from Moulemin was examined by

was uncrystallisable. Werner, however, found a sample of *garjan* oil examined by him (as well as its resin) to be entirely soluble in boiling potash lye. The crystallisable acid extracted from the resin Werner called *Garjanic* ($C_{11}H_{16}O_2$): it is soluble in alcohol or ether but not in weaker. It is dissolved also by ether, benzol, or sulphide of carbon,

D. 708

DIPTEROCARPUS
turbinatus.

The Garjan or Kanyin Oil.

CHEMISTRY.

The amorphous resin, which forms the chief bulk of the substance obtained after the removal of the essential oil, has not as yet been definitely analysed. Flückiger and Hanbury found, however, that after complete desiccation it was not soluble in absolute alcohol. These authors add that a sample of *garjan* balsam of unknown origin yielded a crystallisable substance answering to $C_{24}H_{40}O_2$; and this was devoid of acid character. They would thus appear to have inferred that the *garjan* oil of commerce is not a substance of uniform chemical character, hence they conclude by recommending that "a comparative examination of the product of each of the above named species of *Dipterocarpus* would be highly desirable." Dr. Dymock, while not materially enriching the chemical knowledge of this substance, gives much interesting information as to the medical opinion held regarding the properties of the drug. The admission of different chemical and medicinal results confirms to a large extent the contention advanced in this work, viz., that there are at least two widely different substances sold in the markets of India under the name of *Garjan* oil, the *Kanyin*, and *In Oils* of Burma.

TRADE.
709

TRADE IN GARJAN OR WOOD-OIL.—The above special reports regarding the *garjan* oil of Burma and Chittagong make the usual admission that, owing to the cheap price of kerosine, the trade in wood-oil has very considerably declined. It is now mainly used for torches and in water-proofing, &c. The trade in the medicinal *garjan* oil must be very limited indeed. It appears to be mainly obtained from the Andaman Islands and to be the produce of *D. alatus*, and possibly *D. turbinatus*.

Garjan
Balsam.
710

Flückiger and Hanbury (*l. c.*) state that the world's supply is obtained from "Singapore, Moulmein, Akyab, and the Malayan Peninsula, and is a common article of trade in Siam." (*Conf.* with Mr. Oliver's opinion above as to the plant which yields the Tenasserim oil) "It is likewise produced in Canara in South India." (*Conf.* with remarks regarding *D. indicus*.) "It is occasionally shipped to Europe." The Burma oil is most probably obtained from *D. turbinatus* and *D. alatus* (*Kanyin*) and from *D. tuberculatus* (*In*). Dr. Dymock remarks: "Garjan Balsam is not an article of commerce in Bombay; small quantities may be sometimes obtained in the native drug shops. The Government supplies have been obtained from the Andaman Islands." Dr. Moodeen Sheriff (in his new work on the *Materia Medica* of South India, of which proofs have been kindly furnished to the author) writes that in Madras "wood-oil is pretty common in most large bazars." He describes several forms and gives their prices:—"Of the black or dark brown variety—wholesale, R12 per maund; retail or bazar, annas 10 per pound. Of the red or reddish-brown variety—wholesale, R24 per maund; retail or bazar, R1-4 per pound. Of the pale white or grey variety—wholesale, R18 per maund; retail or bazar, R1 per pound." He adds: "There are several varieties of *garjan* or wood-oil, but out of these, three are generally met with in the bazars, which are known as *Sufed Garjan-ká-tél* or *Sufed Lakrí-ká-tél* (the pale white or grey variety), *Lál Garjan-ká-tél* or *Lál Lakrí-ká-tél* (the red or reddish-brown variety), and *Kálá Garjan-ká-tél* or *Kálá Lakrí-ká-tél* (the black or dark-brown variety)."

713

Fully fifty years ago hopes were entertained that *garjan* oil would become an article of European trade, meeting a demand in the arts. Dr. Royle wrote on this subject, and a member of the Agri-Horticultural Society of India consigned five hundred gallons to London. The effort proved futile, as Dr. Royle reports, because the Custom-house officers refused to pass it except at the highest rate of duty, namely, that for a manufactured article. It seems probable that this obstruction prevented the industrial enterprise of the British manufacturer from being able to discover a use

The Garjan or Kanyin Oil. (G. Watt) **DIPTEROCARPUS turbinatus.**

for an article which has in consequence remained at a nominal value (Conf. with p. 164.)

MEDICINE.

Garjan balsam does not appear to have been used medicinally by the early Hindus. It does not bear any Sanskrit, Arabic, or Persian names. In Muhammadan works on Materia Medica it is first mentioned in the *Makhson* under the name of *Duhn-el-Garjan*. Ainslie was the earliest European medical writer to mention it, and that in his *Materia Medica of Hindūstan*—a work published in 1813. A prior notice occurs, however, in a work by Franklin (*Tracts on the Dominions of Ava*, p. 26) published in 1811. But Ainslie does not seem to have continued to value the drug, since in his larger and final work—the *Materia Indica*—published in 1826, he makes no mention of it. Sir William O'Shaughnessy in

last-named disease has been relieved by its external use with little or no assistance of internal remedies. I have also employed it pretty extensively in the cure of gonorrhœa, and quite agree with what is already mentioned on this point. There are several varieties of gurjun-balsam, but the thin and reddish brown variety is about the best" (*Honorary Surgeon Moodeen Sherriff Khan Bahadur, Triplicane, Madras*). "Useful application in scabies. It did not prove so useful in my hands in gonorrhœa when administered alone. Combined with liqr. pot. and other medicines in dram doses it has been found to be efficacious in certain cases" (*Assistant Surgeon Shib Chundra Bhuttacharji, Chanda, Central Provinces*). "Recently much praised as a cure for leprosy. I have not been able to obtain any remarkable effects from its use" (*Civil Surgeon G. Price, Shahabad*). "The oil prepared into an ointment for external application, and given internally in leprosy in early stage of the disease, undoubtedly arrests further progress, and affords great relief in advanced cases. The ointment is prepared by mixing the oil with lime water in equal parts, and churning it into a creamy substance. It should be well rubbed into the affected parts, for at least 15 minutes, every morning and evening. The oil given internally from one to ten drops, morning and night, in cold water" (*Civil Surgeon S. M. Shircore, Moorshedabad*). "It is a stimulant diuretic used in gonorrhœa and discharges from the genito-urinary organs, also in leprosy, both internally and externally, with lime water" (*Belly Chand Sen, Teacher of Medicine*). "Gurjun oil was used extensively at the penal settlement of the Andamans in the treatment of leprosy. After long trial it was found to act beneficially in many cases as a palliative remedy, but as a specific for the cure of leprosy it completely failed" (*James Reid, Principal Medical Store-keeper to Government, Fort William*). "Has been used both internally and externally in leprosy with apparent benefit" (*Civil Surgeon J. H. Thornton, B.A., M.B., Monghyr*). "It is a very good application for various kinds of skin diseases" (*Doyal Chund'r Shome*).

TIMBER.
717

Structure of the Wood.—Rough, moderately hard; heartwood reddish grey. It is used for house-building and for canoes in Burma. The best Burmese charcoal is made from this and *D. lævis*. (*Gamble*)

Heavy, rather close grained, the sapwood pale brown, narrow, the heart wood darker brown; takes a fine polish (*Kurz*).

DOMESTIC AND INDUSTRIAL USES OF GARJAN-OIL.
PROPERTIES
AND USES.
Varnish.
718

It is extensively employed by the Burmans as torches, but now-a-days to a limited extent only is it used as a lamp oil. It is largely employed in preserving bamboo wicker-work from the attacks of insects and in paving the bottoms of boats. It is also used as a varnish. It is reported to be useful as an ingredient in lithographic ink. In European medicine it is mainly utilised as an adulterant for Copaiba. But it is commonly held that if a process could be discovered of causing it to dry more rapidly, it would come largely into European use as a varnish. It has been suggested that this might be effected by mixing it with some good drying oil, or by evaporating away the essential oil. It seems to the writer, however, that a far more important way of utilising the article might be found in taking advantage of Mr. Laidlay's discovery that it acts as a solvent to caoutchouc. A thick coating of India-rubber is of course perfectly water-proof, but the way in which India-rubber sheetings, over-coats, &c., harden, dry, and crack at one season of the year or stick together at another under the tropical climate of India, would recommend the experiment being made to ascertain if this would be also the case with a water-proofing

Water-
proofing.
719

material made of a solution of India-rubber in Garjan oil have at all events not received the sanction of the manufacturer, and Sir William O'Shaughnessy's opinion is quoted in favour of the desirability of the material for the future. Sir William wrote fifty years ago that Garjan was found a perfect substitute in the arts for the extract of turpentine now much used in the preparation of so-called turpentine paints. In the coarser kinds of house and ship painting it is used as an excellent substitute for lead. It is highly of the property of garjan in preserving wood from the attacks of insects, its defects are slowness of drying, its liability to being brittle.

TESTS FOR GARJAN, COPAIBA AND HARTSHORN. Watson says: "Its entire solubility in cold ether is one of the tests for it."

Habitat.—An evergreen shrub, met with in the North-West Himálaya, from the plains up to 4,500 feet, in the Panjáb, Sind, and South India (ascending to 8,000 feet, and attaining here the size of a small tree); also in Burma, and planted throughout India as a hedge.

MEDICINE.

Leaves.

726

Wood.

727

Plant.

728

Medicine.—Said to have febrifugal properties. The LEAVES are viscid and have a sour bitter taste, from which fact it is in Jamaica called the "Switch Sorrel." Lindley (*Veg. King.*, 384) says the leaves are used in baths and fomentations. The wood, he adds, of *D. dioica* is carminative, and *D. Thunbergiana* is said to be slightly purgative, febrifugal, and aromatic.

SPECIAL OPINIONS.—§ "This PLANT has been identified for me by Dr. Dymock. It grows about Belgaum. Dr. Graham, in his *Catalogue of Bombay Plants*, mentions that *D. Burmaniana* is known in Belgaum as *Dáwa-ká-Jhá*r. It is believed that the powdered leaves of *Bendugi* applied over a wound will heal it without leaving a white scar. It is applied in burns and scalds; said to be useful also in rheumatism. Dr. Dymock gives its Bombay name as *Zakhmi*, from which it may be implied that it is used in the treatment of wounds" (*Surgeon-Major C. T. Peters, M.B., Zandra, South Afghanistan*).

Fodder.—Stewart says the LEAVES are hard and dry, and are only eaten by cattle when very hungry. Reported to have not agreed with the camels at Thal, Afghanistan, during the late campaign.

eat even children. The Bengal fox lives largely on fruits, such as those of *Grewia*, *Zizyphus*, &c.; also field rats, lizards, &c. The late Mr. A. de Reepstorff refers to the fact that the Andaman domesticated dog lives largely on cocoa-nuts, while those of the orange groves of the Khasia hills are fed like pigs on oranges. In the Naga hills and, indeed, throughout India, the dog is mainly fed on rice. But with the Nagas this is so on purpose, as the dog constitutes an important item of human food. Sheep and goats are rare in the Naga country owing to the preference paid to dog's flesh. Before being killed, the dog is often made to eat as much rice as possible. Soon after he is killed and cooked, the contents of the stomach being considered a special luxury.

Habitat—According to the *Flora of British India* there are two forms of this plant α (D uniflorus), a sub-erect annual, and β (D biflorus), a more or less twining plant. The habitats of these forms are not separately recorded, and Mr Baker (the author of the *LEGUMINOSÆ* in the *Flora of British India*), apparently treats of both collectively when he says that it occurs on the "Himalaya to Ceylon and Burma, ascending

D. 758

biflorus.

Horse Gram or Kooltee (or Kúltí.)

VARIETIES.
759

to 3,000 feet in Sikkim; sometimes cultivated. Distributed everywhere in the tropics of the Old World."

Varieties.—While the writer does not possess the means of testing the accuracy of his opinions by the inspection of specimens obtained from all parts of India, he believes it will be found that a mistake has been made in linking the Himalayan with the plains' plant. Roxburgh refers to two forms, one with grey, the other with black seeds, both of which he implies are cultivated in Bengal and Madras. Of the grey-seeded plant (his *D. biflorus*), he remarks that it is erect, with twining branches, and about two to three feet high. He then adds: "I have never found it but in a cultivated state." Again: "This species is much cultivated all over the coast. It requires a dry, light, rich soil. In October and November it is sown either by itself or mixed with *Holcus saccharatus*." In the writer's opinion there would appear to be considerable room for doubt as to whether the grey and the black-seeded forms of Roxburgh are the two forms of modern writers, or whether both of Roxburgh's plants constitute but cultivated races of one of these forms. In popular works, on economic products, the Horse-gram of Madras is viewed as *D. uniflorus*, and under either of these names (*D. biflorus* or *D. uniflorus*), a pulse is described as grown, one might almost say, in every district of India, but chiefly in Madras and Bombay. It is somewhat difficult to believe that a pulse of the tropical plains could be the same as that of the Temperate Himaláya, of which Stewart wrote that it is "grown at 7,000 feet or more." This will appear the more improbable when it is added that the pulse described as met with in these regions is sown and reaped very nearly during the same periods, though in the one case under tropical, and in the other under temperate, influences.

CULTIVA-
TION.
760Green
Manure.
761

Cultivation.—It may be said of the plains that the pulse here dealt with is grown for either of two widely different purposes:—*vis.*, as a green manure, or as food and fodder. It has not been found possible to discover the extent to which the former purpose is pursued by the actual cultivators. The reports on the subject are more directly connected with Government experimental farms, although it would appear as if the experiments described had been the outcome of a recognised native practice. Mr. Robertson, in several of the Saidapet Farm Reports, deals with the advantages likely to accrue from the use of this pulse as a green manure. He writes: "The action of the green manure is two-fold. *First*, the substance of the plant decaying in the soil leaves behind a large quantity of prepared food, ready for absorption by the roots of the succeeding crop; *secondly*, when ploughed in, the structures of the green crop add directly to the amount of organic matters in the soil, and thus improve its mechanical condition, increasing its power of absorbing and retaining moisture, and increasing, in the case of stiff soils, their friability." In another place he remarks: "In several fields, crops were ploughed in, during the past season, and although it is not possible to state what actual value the proceeding had, for no experiments were made, yet estimating the value of such a manure at R4 per ton, it was necessary to produce about 4,500lb per acre to cover the cost of growing it." In still another report Mr. Robertson says: "The horse-gram (*Dolichos uniflorus*) is well suited for culture on sandy soils, for ploughing in, as a green manure." "Last dry season we raised crops that yielded from 2,000 to 3,000lb of plant per acre in a period of about twelve weeks, during which the rainfall did not amount to one inch. In the neighbourhood around Madras, the 'summer crops,' on dry sandy land, are exceedingly precarious; on the average we have not more than one year in four, in which crops sown in June or

D. 761

DOLICHOS
biflorus.

Horse Gram or Kooltee (or kúlti).

CULTIVA-
TION.

of cattle; they are usually ploughed, sown, and the seed covered by a second ploughing if there be time, but if not, the seed is simply scattered broadcast over the natural surface and then ploughed in. As it requires only one good rain after appearing above ground, it frequently gives a fair crop when nothing else can live. When the south-west monsoon rains are too late for *Kamli* it is frequently sown as a substitute in September, but it is also sown largely in November after the first burst of the north-east monsoons. It is pulled up by the roots, thrown into heaps, and then trodden out by cattle. The yield is up to 1,200lb." In a recent report contributed by Mr. H. Sewell, Collector of Cuddapah, there occurs a similar statement: "It requires no cultivation beyond ploughing, and grows on any soil." Mr. H. Goodrich, Collector of Bellary, writes:—"A mixed soil is best suited for the crop. The fields should be ploughed and harrowed once or twice, but not irrigated nor (generally) manured." Mr. Robertson's experience of the pulse on the Saidapet Experimental Farm has been indicated by several passages quoted above, but with regard to the soil, &c., it may be as well to convey his meaning still further. He says it is "a valuable fodder-producer for inferior sandy soils." "The ease with which it may be cultivated recommends it most highly." But several Madras writers give a very different account of the requirements of this plant. For example, in the Survey Settlement Report of South Arcot (see *Selections from the Records of the Madras Govt.*, 1862, p. 109), there occurs the following passage regarding "horse-gram (*Dolichos uniflorus*)": "The land is ploughed four or five different times after the month of May, and the gram sown between the latter part of August and the end of September. It is gathered in the middle of March." In the Manual of the Trichinopoly District (by Mr. L. Moore), page 72, it is stated that "*Kollu* (*Dolichos uniflorus*), or horse-gram, is a four-months crop, being sown in October and reaped in February. It is a precarious crop, as it requires frequent showers, and is destroyed equally by excessive drought or moisture. It is grown to a considerable extent in the Kulittalai Taluk, but not much elsewhere." Writing of Trichinopoly recently Mr. H. Willock says of *Kollu* that "the area of this grain under cultivation is about 27,604 acres, of which 1,297 acres are *fasti* lands. It is a four-months crop, sown in October and reaped in February." "It is cultivated generally in sandy soils and also in other soils when the season for appropriate crops is over." Of Cuddapah District Mr. H. Sewell gives the extent of cultivation in 1887-88 as 14,755 acres, and the outturn 17,70,600 measures. He adds: "It is sown in October and reaped in February." Of Bellary District Mr. H. Goodrich writes of 1887-88, that "the total area under cultivation of this crop is estimated to be 106,805 acres, of which 90,013 belong to Government and 16,792 are *inam*. The season for sowing is from the 3rd August to 7th October, and that of harvesting from 20th December to 21st February. The lowest estimate for the cost of cultivation is given at R1-12, the highest at R5-8, and the average at R3-2-7 per acre. The profits vary from 4 annas (lowest) to R4-4 (highest) per acre; the average being R1-0-2 per acre."

Area.
765Seed.
766Yield.
767

The amount of seed per acre and the yield is variously stated, but of Madras Mr. Robertson wrote in 1871 that in one experiment, 35lb an acre was sown in August and yielded in October 5,640lb of green fodder. Another experiment with 24lb an acre, sown in October, gave in March 450lb of pulse and 1,800lb of straw. But reference has already been made to Mr. Robertson's experiments of cultivating for fodder or green manure horse-gram sown in February and March. The present notices regarding the Madras cultivation of horse-gram may there-

Dolichos biflorus. It may be inferred that very little of *Dolichos biflorus* is actually cultivated in the Provinces, from the fact that it is not described in Messrs. Duthie and Fuller's *Field and Garden Crops*. Mr. Atkinson, however, in his *Himalayan Districts*, pp. 343, 460, 666, says: "Horse-gram—*Gahat*, *Kalath*, the *kulthi* of the plains. The horse-gram is occasionally grown in the hills up to 6,000 feet, and in the sub-montane tract. In the Bhábar it ripens in October." A somewhat striking feature of this pulse or bean is the absence of any allusion to it in the *Ain-i-Akbari*. Abul Fuzl, the author of that useful record of Akbar's times, gives particulars of all the grains, pulses, oil-seeds, vegetables, flowers, and fruits known to the Emperor. Among the pulses and vegetables there occurs *Mung*, *Másh*, and *Moth*—the first two are forms of *Phaseolus Mungo*, and the last is *P. acutifolius*; then *Adess*, the lentil (*Lens esculentus*) is referred to, and *Nakhál*, the common gram (*Cicer arietinum*). *Lobiya* is also mentioned, but whether we are to translate that as *Vigna Catjang* or as *Dolichos Lablab* seems doubtful. At all events, no place is given to *kulthi* and, indeed, it is questionable if that pulse was known to the Persian writers. This fact is difficult to account for, if we admit that the plant of the Himalaya and of Northern India is the horse-gram of Madras, but the absence of any knowledge of it admirably corresponds with the present cultivated area of the plant, *viz.*, in South India and Bombay, the portions of India over which the Emperor Akbar was never able to extend his supremacy. We might, indeed, from this fact be pardoned the assumption that the true habitat of Horse-gram should be looked for in South India rather than on the Himalaya.

Panjab.—Of the Panjab Stewart says: "It is commonly cultivated for its pulse in the Himalaya up to 7,000 feet or more. Occasionally grown outside, near the base of the hills at Ambála (Edgeworth)." "*Kulthi* (*Dolichos uniflorus*)" is referred to in the *Gazetteer of Hoshiarpur District* (page 63) as a *kharif* crop "sown on the poorest hill slopes, which look as if they could produce nothing but stones." In the *Gazetteer of Simla* (page 55) *kulthi* is alluded to as "the most common pulse, growing freely, even upon high meagre soil. The grain is hard and indigestible, mottled with specks of a dark colour. It is eaten in the form of *dál*." On a further page it is again alluded to: "*Kulat* or *Kolath* (*Dolichos uniflorus*—horse-gram) is grown in the inferior *bakhil* lands in the lower villages. Will not grow on the higher lands. Is not sold. Is sown the same time as *Másh*" (= *Phaseolus radiatus*, *viz.*, sown in July and harvested in October), "but ripens 15 days later. To prepare for eating,—it is soaked in water for 12 hours; then reduced to a *mash* on a stone; then made into round balls and steamed. Another way is to roast the grains and then boil them, adding rice."

Central Provinces.—In a recent communication Mr. J. B. Fuller says:—" *Dolichos biflorus* is grown in the southern districts of the Provinces as a cold weather crop. Full details of the area under it are not available, but such statistics as are at hand indicate that its cultivation is of importance only in the Chanda, Bhandara, and Balaghat districts, in each of which it annually covers from 3,000 to 4,000 acres." In the Settlement Reports, referred to under the paragraph of references, mention is made of this pulse, but Mr. Fuller's brief note gives the main facts.

Bengal.—Horse-gram is very little cultivated in the Lower Provinces. It is said to be grown to a limited extent in Shahabad as a fodder, but "not grown in lower Bengal." It is, however, "largely cultivated in Chutia Nagpúr Division, on good land. It is usually sown along with *sirgusa* in August, and receives the same treatment, and is harvested in November-December. The average quantity of seed sown is ten seers per acre,

Horse Gram or Kooltee (or kulthi)	(G. Watt)	DOLICHOS biflorus
<p>and the average produce two maunds, valued at R3 The seed is eaten as <i>dāl</i>, or ground into <i>sattu</i> after being roasted In Chhota Nagpur, proper, about 1½ per cent, of the cultivated area is sown under this crop In Khoorda,* Pooree District, <i>kulthi</i> is usually grown as a second crop on paddy lands" The Rev A Campbell writes that by the Santals this pulse "is extensively cultivated on good high lands It is eaten in the form of <i>dāl</i> and also as <i>sattu</i> To prepare <i>sattu</i>, the pulse is roasted and then ground It is eaten without being further cooked"</p> <p>AREA UNDER HORSE GRAM—In some of the above passages reference has been made to the extent this pulse is cultivated With the exception, however, of Madras and Bombay, it is not of such importance as to require being regular</p> <p>therefore, be furnished for to present date has range returns for Bombay may between one-third and one-fourth of that area as under the pulse In 1887-88, the total of these two Provinces was close upon 1,850,000 acres The Central Provinces have, perhaps, about 10,000 acres, and in the</p> <p>is probable that the rest of acres at the outside, so that tive of the Himalaya, its</p> <p>available, and it is only hasers that the gram of</p> <p>Maaras—the Horse-gram here discussed—is a perfectly distinct pulse from the gram or Bengal gram of most writers (For GRAM see Cicer arctunum. Vol II, No 1061, pp 274 to 284) This caution is the more necessary, since every trade journal and agricultural publication is urging the importance of India as a source of pulses and lentils, &c., to be used as cattle food The importation into Europe of the horse-gram of Madras under the false impression that it was the same as Bengal gram might seriously injure the progress of trade, and the sale of the pulse Lathyrus</p>		CULTIVATION

biflorus.****Horse Gram or Kooltee (or kúlti).****CATTLE-
FOOD.**

divided. Besides their usual fodder one lot got 12 pounds of boiled gram and 12 pounds of ground nut-cake, and the other lot received daily 12 pounds of steeped gram and 12 pounds of ground nut-cake. The results were as follows:—

Animals on Boiled Gram:

	Pounds.
Weight at the commencement of the experiment	6,339
Do. twenty-seven days afterwards	6,576
Increase	237

Animals on Steeped Gram.

	Pounds.
Weight before the commencement of the experiment	6,310
Do. twenty-seven days afterwards	6,576
Increase	266

A similar series of experiments were performed with horses, and the verdict arrived at was in favour of steeped gram. Mr. Robertson performed a further experiment to test the comparative feeding values of maize and horse-gram. He reports: "for the first few days maize was not readily eaten; however, at the end of a couple of weeks, the cattle ate it freely and continued to increase in weight, until at the termination of the experiment, they had increased 71 pounds in weight. The other pair ate gram from the first, but they never made the progress observed by the pair fed on maize, and at the termination of the experiment had only increased 3 pounds in weight." This fact might to some extent be accounted for by the beneficial effect of a change, irrespective of the merits or otherwise of the maize diet.

Another series of experiments were conducted in order to determine the value of gram fodder in comparison with grass and cholam fodder as food for sheep. "The animals fed on grass only gave an increase of 8·26 pounds per each 100 pounds of their live weight, whilst those fed on gram fodder gave 14·5 pounds, and those on cholam fodder 15·58 pounds. The grass was the inferior stuff usually cut for horses." In the *Khandesh Gasetteer* (p. 152) it is stated that many persons prefer *kulthi* to gram (presumably Bengal gram) in feeding horses. It is much to be regretted that no one appears to have published the results of definite experiments to test the relative merits of Bengal gram (*Cicer arietinum*) and Horse-gram (*Dolichos biflorus*). Such experiments would afford exporters the means of judging whether they should commend most, the Bengal or the Madras staple article of horse food, to European dealers. The chemical analysis taken from *Professor Church's Food-Grains of India* (given below) would, however, justify the preference being shown to Bengal gram:—

CHEMISTRY OF THE HORSE-GRAM.

Professor Church publishes the following table of analysis:—

Composition of Horse-gram.

The Professor concludes from 27, and the nutrient coefficient 83 one third of its weight of phosphorus is contained in some districts, 1

value 84

Oil—The BEANS are said to yield an oil, of which little is known.

Medicine—Stewart says the SEEDS are used medicinally in the Panjab. Dr Arjun, in his *Bombay Drugs*, p 40, has the following remark about *Dolichos unguiculatus*. "There are two varieties of this—the red and the white. Both are used for similar purposes. The DECOCTION is used by native females in leucorrhœa and menstrual derangements; it is also given to parturient females to promote discharge of the lochia."

Special Opinion—§ "Sanskrit writers recommend the use of the pulse of this plant as a demulcent in calculus affections, cough, &c. Its employment is said to reduce corpulence. The wild variety is said to be particularly serviceable in eye diseases" (U C Dutt, Civil Medical Officer, Serampore).

Food—The PEA is eaten by the poorer classes of natives, and the PODS and PEAS are also eaten by horses and cattle. The STRAW is a much prized fodder.

Pr., 119; Ain-i-Akbari, Blochmann's Transl., 63; Jour. Agri-Hort. Soc., V. (New Series), p. 37; Indian Forester, IX., 203.*

Habitat.—Wild and cultivated throughout India; ascends to 6,000 or 7,000 feet on the Himálaya. This climber may be seen growing along the borders of fields, which contain tall crops being left to twine round the plants near the margin. In some parts of the country the castor oil plant is a favourite support. The *shím* is also grown very commonly round houses, being allowed to climb on the walls and roof.

History.—Some idea of the probable history of *Dolichos biflorus* may be gathered from the series of quotations given above from numerous authors, and from the very extensive collection of vernacular names, most of which seem to be derived from the Sanskrit *Kuluttha*. The remarks made in the paragraph devoted to the cultivation of that species in the N.-W. Provinces may be specially read in this connection. M. A. DeCandolle (*Origin of Cultivated Plants*) deals with two (or what the writer regards as only one) species of *Dolichos*, viz., *D. Lablab*, Linn., and *D. Lubia*, Forskal. He does not treat of *D. biflorus*, although it is perhaps a more important cultivated plant in India than *D. Lablab*. The line of reasoning urged by DeCandolle seems largely to turn on the origin of the word *lubia*. He says: "Oriental scholars should tell us whether *lubia* is an old word in Semitic languages. I do not find a similar name in Hebrew, and it is possible that the Armenians or Arabs took *lubia* from the Greek *λοβος*, which means any projection, like the lobe of the ear, a fruit of the nature of a pod, and more particularly, according to Galen, *Phaseolus vulgaris*. *Lobion* (*λοβιον*) in Dioscorides is the fruit of *P. vulgaris*, at least in the opinion of commentators. It remains as *loubion* in modern Greek, with the same meaning." The word *Lobiya* occurs among the list of autumn crops, known to Akbar. According to some modern writers it is, in Upper India, almost generic for beans, although applied more especially to two plants, viz., *Vigna Catiang* and *Dolichos Lablab*. The former comes into season in the autumn (*khariṣ* crop), while in the N.-W. Provinces and the Panjáb the latter is sown in autumn and reaped in February and March, so that it is a spring (*rabi*) crop. These seasons do not, of course, apply to all parts of India, since, for example, in Assam and some parts of South India, *D. Lablab* ripens in December. The *Ain-i-Akbari* (a work written in Persian) describes the crops grown in Delhi and Agra during the reign of the Emperor Akbar. A pulse, *Lobiya*, is there spoken of as a *khariṣ* crop. As at the present day, so in all probability in Akbar's time, this would have been *Vigna Catiang*. This is of importance, since the word *Lobiya* appears to be of Persian not Sanskrit importation into the languages of India. Persian scholars do not seem to share M. DeCandolle's ideas regarding a derivation of *Lobiya*, *lubiyá*, *lubiya*, or *luba*, from *λοβος*. The word is accepted as of pure Persian origin, and in Johnson's Persian, Arabic and English Dictionary is given as "a kind of pulse." It may here be added that *labáb* in Arabic means "green fodder." But even if the Persians borrowed the word from the Greeks, the contention here advanced would still remain in its full force. It came to India through the Persians. Hence the writer is disposed to restrict the word *lobiyá* to *Vigna Catiang*, and if this proves correct

DOLICHOS
Lablab.

it is probable none of the species of Dolichos were known to the Persian or Arabic writers of classic times. This conclusion would assign to the species of Dolichos an Indian origin, an idea practically confirmed by the almost universality of certain derivative names in the languages of India

In the *Gazetteers of the North-Western Provinces* the name *lobiyā*

usually called *rausa*. *Ramos* and *rausa* are names given throughout these provinces for *Vigna Catjang*. Of the Meerut District it is said crop, but that *masina* is *biya*, *Dolichos sinensis* names of a *kharij* crop, *Gazetteer* as that of a spring crop. This latter statement may be the result of a mistaken iden-

but may possibly
of all the districts
a spring pulse,
(IX, 203), *lobia*,

Vigna Catjang, is referred to as one of the most useful of the bean tribe for rainy season cultivation. It is said to continue to yield till the beginning of the cold season.

Of the Panjāb, Stewart says *Dolichos Lablab* is known as *catjang* is the only writer who says so

... nacular names of *keo*, *katum*, or *kala mung*. There would seem little doubt but that this is the *kala lobia* of Stewart, and it is probable Stewart added the word *lobia* (an Anglo-Indian generic name for beans) much after the same principle as Baden Powell gives the paragraph heading *Lobiya* to an account of a Kashmir bean, the botanical name of which he gives as "*Phaseolus vulgaris*, L. and, *P. lunatus*, L., red and white haricot beans (mixed)" "These, he

DOLICHOS

HISTORY.

trade in meeting the European demand. It can in no way be said to be a regular article of native cultivation, and the name *loba*, if ever assigned to it, must be viewed as but a modern adaptation of a semi-generic appellation for introduced peas or beans. But to return to the mention of the word *lobiya* in Panjáb recent publications. In the *Gazetteers* of the various districts, *Dolichos Lablab* is practically ignored, while *Vigna Catiang* is frequently mentioned. That pulse is, for example, *rong* in Kangra, *ranyan* in Simla, *rawan* in Montgomery, and *lobia* or *chaula* in Gurgáon. Thus *lobia* appears as a synonym along with other and more distinctly Indian names for *Vigna*. *Chouli* is a very frequently used Hindústani name for it; *Chouli* in Chanda, *chaunro* in Sind, *Chouli*, *chola*, *safed lobek* (white *lobek*), *hurree lobek*, and *gat-vál* in Bombay. Thus ever here and there the name *lobiyá* crops up, in connection with *Vigna*, though practically no authentic case is known of its being given to *Dolichos Lablab*. In South India that name scarcely exists, except perhaps with Europeans. *Vigna Catiang* is *alasandi* in Kánarese, *kárámanalu*, *alachandalu*, or *bobbarlu* in Telugu, and passing up the east coast to Orissa it becomes *lobiya-chhai* in Uriya.

The final conclusions which the writer has arrived at regarding the word *lobiyá* may be expressed briefly:—(1) It is incorrectly applied to any species of *Dolichos* or *Phaseolus*; (2) it is of Persian origin and may by adaptation have been assigned by the early Persian and Mogul conquerors of India to *Vigna Catiang*; but (3) as used by the Indian market gardeners of the present day it is a generic name for any introduced pulse or bean and is in no way specific. A similar expression exists in the use of *Lablab* for the vegetable or unripe pods of beans such as those of *Dolichos Lablab*. The probable origin of *Vigna Catiang* and its claims to being the true *Lobiya* of Indian (Persian) writers will be dealt with in a further volume of this work.

Having thus in a measure disposed of the confusion caused through the association of *lobiyá* with *Dolichos Lablab*, there remains little to be said regarding the history of *Dolichos Lablab* itself. The existence of it as a wild plant, combined with the extensive series of vernacular names, especially those of Lower, Eastern, and Southern India, leave no room for doubt as to its being a native of India, and more especially of the portion of India indicated as the area of its indigenous habitat. The Sanskrit names given to it are doubtfully correct, and although we may be unable to follow DeCandolle in the idea that, according to Sanskrit literature, it has been cultivated in India for 3,000 years, there is everything in favour of the supposition that it was a regularly cultivated crop long anterior to the Aryan invasion of India. It may thus, at an early date, have had assigned to it the Sanskrit names from which some of the vernacular names for the plant are clearly derived. This conclusion would considerably enhance the antiquity of its cultivation in India.

CULTIVATION.

CULTIVA-
TION.
MADRAS.
793

Madras.—In the Trichinopoly Manual *Dolichos Lablab* is said to be a six months crop: sown in July and August, reaped in February and March. In a report, furnished for the present work, the Collector (Mr. H. Willock) says the area of cultivation is 3,934 acres. The annual outturn per acre amounts in value to R10, the cost of production being R5. He adds that it is cultivated on all soils along with the staple food-grains. Mr. H. Goodrich, Collector of Belláry, writes that the area in his district under this crop is only 350 acres. It is sown from June to August and reaped from October to December. It is usually sown with other pulses in the proportion of 1 to 5. The cost of cultivation and profit cannot therefore be

CULTIVATION.

several varieties of this climbing bean, one of the more distinct being that named *D. purpureus*, a separate figure of which is given in *Plate XXXIV. B.* "Their chief distinguishing characters have reference to the colour of the flowers, the shape and colour of the pods, and the colour of the seeds." "In these provinces," these authors continue, "*sém* is commonly grown along the borders of tall crops, and allowed to twine itself round the plants standing on the margin. The castor oil plant is a favourite support. It is also occasionally grown in little patches round houses, and allowed to trail over the walls and roof. It is never grown as a field crop by itself, since it would require an artificial support which would add too much to the cost. It is used as a vegetable, its long pods, picked in unripe condition, forming a favourite addition to the daily mess of green food. It is seldom if ever grown for its grain." The reference to its climbing on the castor oil plant may be accepted as showing that it is a *râbi* or spring crop. Mr. Atkinson says of Kumâon that there are six varieties commonly cultivated in gardens and very occasionally as a field crop.

BENGAL.
799

Bengal.—The same remark as given under the Central, is applicable to the Lower Provinces. It is not a regular agricultural crop, though few huts exist without at least one plant trailing over the enclosure. The Director of Land Records and Agriculture says: "Different varieties of *shim* or *lablab*, distinguished from one another by colour, size, form, nature of stripes, &c., of the pod, are cultivated all over Bengal as a garden vegetable. A grass-coloured, small variety, of very indifferent flavour, is found wild in the jungle of Madhupur." The Rev. A. Campbell (a most painstaking observer) has furnished the writer with a complete set of all the cultivated and wild plants of a large portion of Chutia Nagpûr. Of this pulse he says it is largely cultivated, the legumes being eaten, but he does not appear to have found the plant wild. Roxburgh, however, in his *Flora Indica*, says: "Of this species there are known to me five varieties in a cultivated state, and two wild." Of the two wild plants he calls the one *Ban-shim*, in Bengali, and *Adavi-chikurkai* in Telegu. This he describes as "smooth in every part, and frequently biennial, if not perennial. It is never cultivated, nor any part of it used." Of his other wild form he says: "It is found with the former wild in the hedges, &c., near Samulkota, and differs from it in being very downy; both have red flowers and dark grey mottled seeds. No part of these two varieties is made any use of." Under *Dolichos lignosus*, Willd., he describes some six other cultivated beans. These by the *Flora of British India* have all been reduced to *D. Lablab*, so that, according to Roxburgh, there are some thirteen forms of the plant. Of his cultivated forms under *D. Lablab*, Roxburgh accepts that known as *Annapa* in Telegu as the most typical. He writes of it: "The whole of this plant has a heavy disagreeable smell, something like the green bug. It is much cultivated in the fields during the cold season, and delights in a rich black soil, which cannot be flooded by rains. Like *Bobra*, it requires three months from the sowing, till ripe; yields in a good soil, about forty-fold. These seeds bear a low price, compared to most other sorts of grain. They are much eaten by the poorer classes, particularly when rice is dear. They are not palatable, but reckoned wholesome substantial food. Cattle are also fed with the seeds, and they are remarkably fond of the straw. It is said to make cows yield much milk." Of the other forms of *D. Lablab*, Roxburgh seems to convey the idea that they are garden products and not field crops. Under *D. lignosus* he writes: "I include under the above definition many varieties, some of them hitherto deemed distinct species. All are cultivated during the cold season in the gardens and about the doors of the natives, forming not only cool, shady arbours, but furnishing them with an excellent

The pod of *Dolicho*

is said to be "flat, linear or oblong recurved, 2—4 seeded and 1½ to 2 inches long, by ¼ to ½ inches broad, tipped with the hooked persistent base of the style." The possibility of a mistake may be accepted as a justification for doubting the propriety of dealing with these plants collectively, the more so since Assam, by the above report, would stand by itself in the record of periods of sowing and reaping. The writer may add, however, that he is personally acquainted with *Dolichos Lablab*, as met with in Assam, and he collected a sample of it even in the Naga hills, there known as *kechu*. This latter fact is of very considerable

AREA.
802

when about a foot high it is allowed to twine round bamboo trellis work."

AREA OF CULTIVATION.

It is difficult, if not impossible, to discover the area under a crop which, like the present, exists as a garden climber, each peasant having one or two plants. It is grown all over India, becoming less abundant towards the north than in the southern and western divisions of the country. In Madras and Bombay, however, it is to some extent a field crop. In Madras in 1885-86, there were stated to have been 65,664 acres under the crop, in 1886-87, 78,700 acres, and in 1887-88, 35,724 acres. In Bombay the area appears to be greater. In 1885-86, 72,660 acres, in 1886-87, 91,652, and in 1887-88, 95,188 acres.

The Madras returns for 1887-88 may, however, be incorrect, since ambiguity often exists through the figures of area appearing under different names, such as "beans," "avarī," "mochai," or "anumulu," &c.

CHEMISTRY.
803

Chemical Composition.—In his *Food Grains of India*, Professor Church publishes the results of five analyses of this pulse. He accepts the fourth as fully expressing the character of the grain. The following abstract from the Professor's table of analysis may be here given :—

Composition of Lablab Beans.

	In 100 parts.		In 1lb	
	Husked.	With husk.	Oz.	Grs.
	(3)	(4)		
Water	12.1	12.1	1	410
Albuminoids	24.4	22.4	3	255
Starch	57.8	54.2	8	294
Oil	1.5	1.4	0	98
Fibre	1.2	6.5	1	17
Ash	3.0	3.4	0	238

From these figures the Professor concludes that the "nutrient ratio deduced from analysis (4), is 1 : 2.5, the nutrient value is 80. It will be seen, however, on comparing the several analyses given above, that the percentage of albuminoids is rather variable. The extreme range is probably not more than 6 per cent. Of the numerous forms of *Lablab* the majority are eaten as a green vegetable." The concluding sentence is of importance, since, to judge of the value of this plant as a source of human food, the green pods would have to be analysed.

807

DOMESTIC.

Roots.

808

Food and Fodder.—The extensive series of quotations from numerous writers given above will, it is believed, have conveyed the main facts regarding the GREEN PODS as a vegetable, the RIPE SEEDS as a pulse eater by certain classes or employed as cattle food, and of the STEMS as constituting a valued fodder. It is only necessary to repeat these points here in order to establish, in their proper places, the numbers to be assigned to these products.

Medicine.—The only record of this plant being used for medicinal purposes is that published above in the paragraph of cultivation in Assam.

Domestic Uses.—The root are said to be used in Assam to poison wild animals. This is a remarkable fact, since the whole plant has hitherto been supposed to be wholesome.

Arjun, Bomb. Drugs, 201; Irvine, Mat. Med., Patna, 74; Lisboa, U. Pl. Bomb., 201, 211; Foulé, Fik. Pl., 374; Home Dept. Cor. regarding Pharm. of Ind., 230; Indian Forester, III., 237.*

Habitat.—A stout, tall, climbing shrub of Bengal, Assam, the Deccan Peninsula, from the Corcan southward to Ceylon.

Fibre.—Contains an exceedingly strong **FIBRE**, which is extracted by the natives. The Rev. A. Campbell says that in Chutia Nagpur the Brahmans sometimes make their *paitha* or sacred threads from this plant. Lisboa says that in Bombay the creeper is used as a substitute for **ROPE** to tie up bundles of firewood.

Medicine.—The **LEAVES** are much employed as an application to boils and abscesses. The **ROOTS** and tender **STALKS** are considered emetic and expectorant. Ainslie tells us that the *Cytians* suppose the root and tender stalks to possess virtues in dropsical cases; "they sicken, and excite expectoration; though I could not obtain much information of a certain nature respecting them, it is to be presumed that they operate in a manner somewhat similar to the root of *Asclepias Curassavica*, which, according to Browne, in his *Natural History of Jamaica*, the Negroes use as a vomit." The *Pharmacopœia of India*, after alluding to the value of the leaves as an external application, adds: "According to native testimony, it has the same emetic and expectorant virtues as *Damia extensa*. Irvine (*Mat. Med., Patna*) says this drug is used in colds and eye diseases to cause sneezing; dose gr. i to $\frac{1}{2}$ drachm. Dr. Dymock repeats the above information, but adds that all parts of the **FOLLICLES** are intensely bitter, and that the brown **MEALY SUBSTANCE** that covers them is given in Bombay to cattle as a medicine.

Special Opinions.—§ "The tender end of the creeper with its **JUICE** when touched into the nose causes excessive sneezing. This remedy is commonly used by Hordlis to make sick people sneeze" (*V. Umme-ga Ben, Mattapollan, Madras*).

Food.—Ainslie, while alluding to the report that the **LEAVES** are eaten as a green vegetable, doubts the accuracy of this opinion, because of their nauseate reputation. Many subsequent writers, however, affirm that they are regularly eaten. Thus Thwaites says, they are eaten in Ceylon, and Lisboa says of Bombay, the "leaves are used as a vegetable."

DREPANOCARPUS, Mey.; Gen. Pl., I., 546.

According to the *Genera Plantarum* there are only eight species belonging to this genus, and these are all American. The chief characters, as established by the *Genera Plantarum*, in the separation of this genus from *Dalbergia*, are the versatile anthers, and lunate to reniform pod. These characters, according to Kurz, are possessed by three Burmese trees, *viz.*, *Drepanocarpus Cumingii*, *D. monospermus*, *D. reniformis*, and *D. spinosus*. Following the usual course pursued in this work, however, of accepting the synonymy of the *Flora of British India*, these have been dealt with under *Dalbergia*, which see.

Habitat.—A lofty, deciduous tree, with light-brown bark, peeling thin flakes ; a native of Nepál and Eastern Bengal (ascending to feet), Assam, Chittagong, and Burma.

TIMBER.

843

Structure of the Wood.—Grey, often streaked with yellow, soft, s well, takes a good polish, and neither warps nor splits. Weight 3 cubic foot. Canoes cut out of it green are at once used, even when alternately to wet and the heat of the sun. In Northern Benga Assam it is now very extensively used for tea-boxes, for which purpo admirably fitted. It is also made into cattle troughs and other or domestic utensils. It came into use for tea-boxes in 1874-75 when wood became scarce. The seeds are small but germinate freely, s for planters this is one of the most useful of trees.

846

DUCKS, TEALS, GEESE, AND SWANS.

The large and very important assemblage of Indian birds which be accepted as represented by the Duck, the Goose, and the Swan, c tutes one of the best marked sections of the Order Natatores of Zoolc They are characterised by a more or less perfect state of web-foc They have short, compressed tarsi and a flattened bill. In the Goose an having short, compressed tarsi and a flattened bill. In the Goose an Swan the bill is pointed, has a sharp nail-like hook on the tip, and as towards the base. In the Ducks and Teal the bill is nearly of one br throughout and quite flat, with well-developed lateral laminations, whic employed in sifting the water in the search for food.

The following are the chief edible birds of the above assembl met with in India :—

847

1. *Anas boscas*—The Mallard.

This is universally regarded as the best Indian Duck for the table, 1 followed in point of merit by the Pintail, and after that the Gadwall. Mallard is a, comparatively speaking, common species, though less s the western side of the continent.

848

2. *A. caryophyllacea*.—The Pink-headed Duck.

849

3. *A. pæcilorhyncha*.—The Indian spotted-bill Duck.

850

4. *Anser albifrons*.—The White-fronted or Laughing Goose.

	<p style="text-align: center;">DURIAN, OR CIVET-CAT FRUIT TREE.</p>
	<p>Vern.—<i>Durian</i>, MALAY; <i>Duyin</i>, BURM.</p>
	<p>References.—Linschoten, <i>Voyage to the East Indies in 1596</i>, Vol. II., pp. 34, 51-53, 68; <i>Burma Gazetteer</i>, Vol. I., 429; <i>Burma Gazetteer</i> by Major Macneill, p. 230; Mason, <i>Burma and Its People</i>, 447 and 754; <i>Annual Report of the Settlement of Port Blair for 1870-71</i>, pp. 33-40; <i>Kew Off. Guide to Bot. Gardens and Arboretum</i>, 67.</p>
	<p>Habitat.—A large tree of the Malay Islands, wild in South Tenasserim, and cultivated as far north as Moulmein. The large flowered form, viewed by many botanists as the wild condition, is, by the <i>Flora of British India</i>, treated as a different species, under the name of <i>D. malaccensis</i>, Planch.</p>
FOOD. Fruit. 877	<p>Food.—Produces a large FRUIT, 10 inches by 7, called the <i>Durian</i>, or civet-cat fruit, of which the cream-coloured fleshy aril or pulp enveloping the seeds, like that of the Jack-fruit, is the part eaten. It is well known and much prized, but eaten by Natives only. It has a strong odour, considered by Europeans as highly offensive, which resembles that of putrid animal matter combined with rotten onions. The fruit is, however, highly prized, even by Europeans, when once the prejudice to the smell is overcome. The Burmans regard it as extremely luscious, and it forms a considerable part of their food. The roasted SEEDS and the boiled unripe fruit are also eaten as vegetables. John Huyghen van Linschoten's description of this fruit might be read as if written recently instead of 300 years ago. In his time it was perhaps as extensively cultivated as at the present. The Kings of Burma used to import large supplies of the fruit; indeed, it constituted a by no means unimportant article of traffic from Lower to Upper Burma.</p>
Seeds. 878	
Vegetable. 879	<p>"The <i>Dorian</i> is regarded with peculiar favour by the natives and also European residents in the country. Colonel Biggs writes thus about it: 'It is so rich and highly flavoured, that it resembles marrow rather than fruit, and is subject when ripe to speedy decomposition, when its odour becomes disagreeable, a circumstance which has made it disliked by some who have not been able to eat the fruit fresh from the tree; it is beyond question the finest fruit in the world'" (<i>Burma Gazetteer</i>, written by Major Macneill).</p>
	<p style="text-align: center;">DYERA, Hook. f.; <i>Linn. Soc. Jour.</i>, XIX.</p>

6

Echium sp.? BORAGINÆÆ.

Under the above name Dr. Moodeen Sheriff, in *Suppl. Pharm. Ind.*, 133, and Dr. Dymock, in his *Mat. Med. W. India*, 2nd Ed., 571, have described the well-known bazar drugs *Gaozabán* and *Gul-i-gaozabán*. Considerable confusion exists in the literature of this subject, for not only is it probable that the products of entirely different plants are sold in the bazars as *gao-zabán*, but the correct botanical determination of the true *gao-zabán* is still doubtful. Moodeen Sheriff sent a specimen, so named, to Kew some years ago, and it was determined as a species of *Echium*. Stewart regarded the leaves of *Onosma echiioides* as the *gao-zabán* of the Panjáb, and in this opinion he has been followed by Atkinson, Murray, &c. Royle, in his *Illustrations of the Himalayan Botany*, p. 304, says that, "Onosma bracteatum is called *gao-zabán*, or ox-tongue, and has *fighulus* and *bughúsun* assigned as its Greek names." Sir W. O'Shaughnessy (*Beng. Disp.*, 420, 495) regarded *Cacalia Kleinia* (COMPOSITÆ)—a synonym for *Notonia grandiflora*—as the true *gao-zabán* of the Indian physicians, and pronounced the drug obtained from *Onosma bracteatum* as useless. But he describes his *Cacalia* as prickly, which it is not, and thus leaves room for a grave doubt as to the accuracy of his determination. He specially mentions that the drug is prized in Bombay, while Dymock neither gives the properties of that drug. Birdwood wrote: "All Indian authorities refer *gao-zabán* to the above plant (*C. Kleinia*), but the *gao-zabán* of the bazars is also derived from *Anisomeles malabarica*, *R. Br.*, LABIATÆ; *Trichodesma indicum*, *Br.*, *Heliotropium ophioglossum*, *Stocks*, and *Onosma bracteatum*, *Wall.*, BORAGINÆÆ." Lastly, Dr. Aitchison, in his report on

The Gaozabán; the Kesur

(J. F. Duthie)

ECLIPTA
alba.

as *gao-zaban*. On the whole therefore, it appears tolerably certain that the true *gao-saban* of Indian bazars is derived from one or more species belonging to the Boraginaceæ family. See *Onosma bracteatum*. (For the above note on *Echium* the Editor is responsible, and regrets that it was omitted to be described under *Caccinia glauca*, which would appear to be the true source of the *gao-saban*.)

ECLIPTA, Linn; Gen. Pl., II, 361.

in Bengal of anointing the heads of infants with the juice of the fresh plant (*Eclipta*) to cause apparent growth of hair to become black. This is repeated once or twice, the hair being washed with the juice of the plant as having any virtue in permanently changing the color of the hair. *Eclipta* is here used for *marigold*. I have never seen *Viola* used. (Dr W. Dymock, London). *Eclipta prostrata*, var. *erecta*, is used on this side of India for imparting a black color to the hair of the scalp, which is called *javala* (or *javala* in some parts). *Eclipta* *Sargam* Sakti *Arjun* *Fatut*, L. *Ala*, *Corgui* = *Tr. gr.*

13

Root.

14

Medicine.—It is an old-established Hindu medicine, principally used as a tonic and deobstruent in hepatic and splenic enlargements, and in various chronic skin diseases; in the latter case, it is also pounded and applied externally. The YELLOW KIND, *peela bhangra*, described by the author of the *Makhzan-el-Adwiya*, is *Wedelia calendulacea*; and, according to Dutt, is the kind mostly used in Bengal. Mr. Wood considers that the plant will be found eventually of greater service than *Taraxacum* in hepatic derangements. The expressed JUICE is recommended in the Pharmacopœia of India as the best form of administration. In Bombay, the natives use the juice in combination with aromatics, such as *ajowan* seeds, as a tonic and deobstruent, and give two drops of it with eight drops of honey to new-born children suffering from catarrh. It also forms an ingredient of a remedy used in the Concan for tetanus (*Dymock*). The FRESH PLANT, mixed with Sesamum oil, is applied externally in elephantiasis. Murray writes that in Sind the expressed juice of the roots is employed as an emetic. It is also purgative. The Rev. A. Campbell states that in Chutia Nagpur the root is applied in conjunctivitis and galled necks in cattle.

SPECIAL OPINIONS.—§ "The juice of the LEAVES is given in one tea-spoon-ful doses in jaundice and fevers. The ROOT is given to relieve scalding of the urine in doses of 180 grains mixed with salt" (C. T. Peters, *M.B., Zandra, South Afghanistan*). "It is anodyne and absorbent, and relieves headache when applied with a little oil. It is an excellent substitute for *Taraxacum*" (*Kanni Lal De, Bahadur*).

Habitat.—A large elegant bush, almost leafless when covered with its clusters of yellow sweet-scented flowers. Found along the Himalaya from Nepal to Sikkim and Bhutan, between 4,000 and 9,000 feet altitude, and recently met with plentifully on the mountains of Manipur, extending to the northern frontier of Burma.

Fibre.—The strong, tough fibre obtained from the long, straight, sparsely-branched TWIGS of this bush must, sooner or later, become one of the most valuable of Indian fibres. The finest qualities of NEPAL PAPER are made from this plant, which produces a whiter paper than that obtained from *Daphne cannabina*, *Wall.* The chemistry of *Edgeworthia* fibre, and the probable extent to which it is used in Nepal paper-making, will be found discussed under *Daphne cannabina*, *Wall.*; Vol. III., 20.

Structure of the Wood.—Grey, light, soft, with little lustre (*Gamble*).

Habitat.—A large tree of the Eastern Himālaya, from 6,000 to 8,000 feet; the Khāsia Hills, Sylhet, and Tenasserim; also in Kánara.

Food.—The FRUIT, which ripens in September and October, is eaten by the natives.

Structure of the Wood.—Light brown and soft; it is used for house-building, tea-boxes, and charcoal.

Domestic Uses.—The seeds of this tree are used for a similar purpose as those of *E. Ganitrus*. See *Beads*, Vol. I., p. 431.

Elæocarpus oblongus, *Gærtn.; Fl. Br. Ind., I., 403; Wight, Ic. t. 46.*

Vern.—*Bikki*, NILGHIRIS.

References.—*Beddome, For. Man. 38; Gamble, Man. Timb., 57; Dals. & Gibs., Bomb. Fl., 27.*

Habitat.—A large tree, found in Southern India, and in Burma.

Structure of the Wood.—White, strong, and tough, and adapted for the lathe (*Beddome*).

E. robustus, *Roxb.; Fl. Br. Ind., I., 402; Wight, Ic. t. 64.*

Habitat.—A stiff hairy herb, with wrinkled crenate radical leaves, distributed throughout the hotter parts of India.

MEDICINE.

Root.
81
Leaves.
82

Medicine.—Rheede says that a decoction of the ROOT and LEAVES is given, on the Malabar coast, in cases of dysuria. In Travancore the natives are reported to boil the bruised leaves with rice, and give them internally for swellings or pains in the stomach. The Rev. A. Campbell states that in Chutia Nagpur, a preparation from the root is given for fever.

Mukna is a tuskless male elephant ; tame females used in hunting are called *kankies*.

In the *Rig Veda* the elephant is mentioned once or twice under the name of *Migrohasi* (the beast with a hand), and in the *Atharvan* he is exalted as the mightiest and most magnificent of animals. But there is little in early Sanskrit literature to justify the inference that the elephant was then domesticated. The word *Elephant* is supposed by some to have been derived from *Pilu* in Sanskrit and *Fel* in Persian, which, with the Arabic article *El*, became *el-fil* and *Elephas* in Greek. The Hindu god of wisdom, *Ganesh*, has the body of a man with the head of an elephant.

were regarded as the best.

Varieties and Races of Elephants.—According to most writers there is but one species of elephant met with in Asia. Some authors, however, view the elephant of Ceylon as forming, with that of the Sumatra one, a distinct species (*Elephas sumatranus*). Jerdon says of this form "The Sumatran Elephant has 20 pairs of ribs" (the Indian has 19 and the African 21) "and the laminae of the teeth are wider than in the Indian species. It is said to be of a more slender make and to be more remarkable for its intellectual development than the Indian." A belief in the superior intellectual powers of the Ceylon as compared with the Indian elephant seems to have prevailed, at least for the past 300 years. John Huyghen van Linschoten thus wrote of Ceylon: "It hath diverse elephants, which are accounted for the best in all India, and it is by dayle experience found to be true, that the elephant of all other places and countries being brought before them, they honour and reverence these." Sanderson, who is holding that the Ceylon elephant is the same as the Indian

The Indian Elephant.

stature and well adapted for life on the hills. The Shán elephants are tall, massive, and handsome, but, like the Ceylon race, are very frequently tuskless. The Burmese elephant resembles more the Nepál animal in being, as Captain Hood remarks, "more compact than those of Hindústan and superior for hill work, carrying loads over steep places and across swamp, or boggy ground, and they are excellent for draught purposes." Steel remarks of the Chittagong race that they "are good all round and make the best *koonkees*; the Assamese are large, both tall and massive, and excellent for hunting purposes."

Speaking of the classification of elephants as adopted by the Natives of India from the standpoint of their appearance and utility, Sanderson says: "Elephants are divided by Natives into three castes or breeds, distinguished by their physical conformation: these are termed in Bengal *Koomeriahs*, *Dwásálas*, and *Meerga*, which terms may be considered to signify thoroughbred, half-bred, and third-class. The term *Koomeriahs* signifies royal or princely. *Meerga* is probably a corruption of the Sanskrit *Mirga*, a deer; the light build and length of leg of this class of elephants suggesting the comparison *Dwásála* in Persian means two things or originals, and in reference to the elephant, signifies the blending of the first and third castes into the intermediate one. Only animals possessing extreme divergence, rank as *Koomeriahs* or *Meergas*; and the points of these breeds (if they may be so called) do not amount to permanent, or even hereditary, variations. Whole herds frequently consist of *Dwásálas*, but never of *Koomeriahs* or *Meergas* alone; these I have found occur respectively in the proportion of from 10 to 15 per cent. amongst ordinary elephants." Sanderson enumerates the characters of the *Koomeriahs* as follows, "barrel deep, and of great girth: legs short (especially the hind ones), and colossal, the front pair convex on the front side, from the development of muscles; back straight and flat but sloping from shoulder to tail, as an up-standing elephant must be high in front; head and chest massive; neck thick and short: trunk broad at the base and proportionately heavy throughout: bump between the eyes prominent: cheeks full: the eye full, bright and kindly: hind quarters square and plump: the skin rumpled, thick, inclining to folds at the root of the tail, and soft. If the face, base of trunk, and ears, be blocked with cream-coloured markings, the animal's value is enhanced thereby. The tail must be long, but not touching the ground, and well feathered."

A pronounced *Meerga* is the opposite of these characters, especially in possessing long legs and an arched back. It is well suited for quick marching on account of its lighter weight and length of legs.

The *Ain-i-Akbari* gives the classification of elephants as recognised in Akbar's time into four classes, *vis.*, (1) *Bhaddar*—"It is well proportioned, has an erect head, a broad chest, large ears, a long tail, and is bold and can bear fatigue. They take out of his forehead an excrescence resembling a large pearl, which they call in Hindi *Gaj manik* (Elephant's pearl); (2) *Mand*, a large black form said to have an ungovernable temper; (3) *Mirg*, a lighter coloured animal, and (4) *Mir*, an animal with small head which obeys readily but is easily frightened.

The so-called white elephant, held sacred in Burma, is an albino condition. Steel says: "its very name has become a synonym for something expensive, useless, and extraordinary; yet we are assured that there is no such thing as a white elephant." Archibald Forbes gives, in his *Glimpses Through the Cannon Smoke*, a humorous account of the sacred white elephant of Burma. As a rule the pale-coloured form known as the white elephant is a sickly animal, his legs being swollen at the joints and often covered with tumours. The colour is at most a dirty grey, but the

skin underneath has often a pinkish colour, seen more especially when the animal goes into the water

CAPTURE OF WILD ELEPHANTS.

HERDS —The elephant is a gregarious and polygamous animal, living in herds, the members of which are presumably all related to each other. Each male is specially attentive to a selected number of the females of the herd, but in the question of supremacy, the males often fight amongst themselves, and the most powerful are the leaders of the herd. At

CAPTURE OF

often nobly cover the retreat of his cows." Sir Victor Brooke describes the herd from which he bagged the largest Indian tusks on record as follows: "There were about thirty elephants in the herd, and

entertained any feeling but that of intense admiration and wonder. At length the great stream was, we believed, over, and we were commencing to arrange our mode of attack, when that host in sight which called forth an ejaculation of astonishment from each one of us. Striding thoughtfully along in the rear of the herd, many of the members of which were, doubtless, his children, and his children's children, came a mighty bull,

the like of which neither my companion, after many years of jungle experience, nor the two Natives who were with us, had ever seen before. But it was not merely the stature of the noble beast which astonished us, for that, though great, could not be considered unrivalled. It was the sight of his enormous tusks, which projected like a long gleam of light into the grass through which he was slowly wending his way, that held us rivetted to the spot."

METHODS OF CAPTURE.—Taking advantage of the fact that these noble animals thus live in herds and frequent definite paths in the forests, they are captured in various ways, *viz.*, by digging pits into which they fall, the mouths of which are covered over with a light frame-work of boughs and leaves: by driving them along one of their most frequented paths into an enclosure. The single elephants occasionally met with are also captured by means of tame females, the riders disguising and screening themselves as much as possible, and after having surrounded their prize, the attendants slip off the tame elephants and secure the feet of their victim.

Sanderson (*Thirteen Years among the Wild Beasts of India*, p. 101), gives a spirited account of his early attempts in capturing herds by driving them into an enclosure (the *Kheddah*). He writes of Mysore in 1873: "I knew nothing of elephant-catching at the time, nor had I any men at command who did; but I knew where there were plenty of elephants, and I was well acquainted with their habits. Some of the Maharajah's *mahouts*, who were amongst my following, had been accustomed to catch single elephants with trained females and in pitfalls, but they had never heard of any one attempting the capture of a whole herd. It was said that Hyder had made a trial, a century before, in the Kakankote jungles, but had failed, and had recorded his opinion that no one would ever succeed, and his curse upon any one that attempted to do so, on a stone still standing near the scene of his endeavours. Consequently, all the true Mussulmans who were with me regarded the enterprise as hopeless—though they judiciously kept that opinion to themselves." Mr. Sanderson then narrates the features of his system, which may be briefly described as the surrounding of a favourite resort of elephants by certain preliminary works prior to the arrival of the elephants, particularly the construction of a strong *kheddah* protected by a trench. When these preparations have been completed, the arrival of the elephants is awaited, but on their arrival some 300 men are rapidly assembled and the elephants, frightened by the noise made by these beaters, are at first made slowly, and later on with a rush, to advance into the *kheddah*. As soon as the last animal has entered, a man, screened from observation, cuts the rope by which the door of the trap is held, and this, closing by its own weight, the herd is captured. The beaters then surround the *kheddah*, and by drums, guns, and torches frighten any brave animal who may threaten an attack upon the enclosure. After vainly struggling for a time the frightened monsters of the forest crowd together in the centre and offer very little further attempts upon the stockaded trap. Food and water are supplied to them, and after all arrangements have been completed, and the animals have become in a measure accustomed to their captive state, tame female elephants, with one or two attendants, enter the *kheddah*. These singling out the largest victims separate them from the herd, two females, getting one on each side, hustle [their prisoner towards a tree. The attendants slip off the tame elephants and secure its hind legs with strong ropes or chains with which they also attach it to the tree. Alarmed at this procedure, when efforts at freedom are now unavailing, it struggles violently, but in time submits. According to Mr. Sanderson the strongest and bravest animals become the most docile when thus convinced that they

The Indian Elephant.	(G. Watt.)	ELEPHAS indicus.
<p>have been conquered. As soon as all have been secured, they are each in turn led out of the <i>kheddah</i> between tame elephants and picketed in a place — and through — they get accus- e attendants by, they be allow them- successful is</p> <p>this treatment that the attendants after a few days are enabled to ride them and commence the process of training to a code of signals, gestures, and words. MODE OF
HUNTING.

forget all cautiousness, and without fear they enter at the door. A fearless hunter, who has been lying concealed, then cuts the rope, and the door closes. The elephants start up, and in their fury try to break the door. They are all in commotion. The hunters then kindle fires and make much noise. The elephants run about till they get tired, and no strength is left in them. Tame females are then brought to the place, by whose means the wild elephants are caught. They soon get tame.

"From times of old, people have enjoyed elephant hunts by any of the above modes; His Majesty has invented a new manner which admits of remarkable *finesse*. In fact, all excellent modes of hunting are inventions of His Majesty. A wild herd of elephants is surrounded on three sides by drivers, one side alone being left open. At it several female elephants are stationed. From all sides male elephants will come to cover the females. The latter then go gradually into an enclosure, whither the males follow. They are now caught as shewn above."

Abul Fazl's description of the construction of an enclosure, the door of which is secured by the cutting of a rope, is practically that pursued by Sanderson. The fact that after being frightened for a time by the noises and fires of the men outside the enclosure, the animals, as if in despair, commence to eat the food provided for them, just as described also by Sanderson, shows how accurately the author of the *Ain-i-Akbari* had observed the Elephant-capturing operations pursued in Akbar's time.

Mr. Blochmann gives, as a footnote to the above, an account of a capture of elephants made in the presence of the Emperor Jahángír, which might be almost read as a scene from Mr. Sanderson's most detailed descriptions of his Kheddah operations. The passage is as follows:—"A large number of people had surrounded the whole jungle, outside of which, on a small empty space, a throne made of wood had been put on a tree as a seat for the Emperor (Jahángír), and on the neighbouring trees beams had been put, upon which the courtiers were to sit and enjoy the sight. About two hundred male elephants with strong nooses, and many females, were in readiness. Upon each elephant there sat two men of the Jhairyah caste, who chiefly occupy themselves in this part of India (Gujrat) with elephant-hunting. The plan was to drive the wild elephants from all parts of the jungle near the place where the Emperor sat, so that he might enjoy the sight of this exciting scene. When the drivers closed up from all sides of the jungle, their ring unfortunately broke on account of the density and impenetrability of the wood, and the arrangements of the drivers partially failed. The wild elephants ran about as if mad; but twelve male and female elephants were caught before the eyes of the Emperor" (*Iqbál-námah*, p. 113). An earlier writer, Linschoten (frequently placed under quotation in this work), speaks of herds of a thousand elephants being surrounded, and a selection of a hundred or more made. Linschoten's account is historically of interest, since it shows that the Kheddah system was followed in Burma 300 years ago:—"They are found also, he says, in India, and in Bengala, and in Pegu great numbers, where they (use to) hunt them with great troupes of men, and tame elephants, and so compasse, and get into a heape a thousand or two (at the least), whereof they choose out a hundreth or more as they néede, and let the other go, that the Countrey may alwaies have great store. Those they (doe) in time (bring up and) learne (them to travel) with (them and to indure) hunger and thirst, (with) other inventions, so long that they beginne to understand men when they speake. Then they annoint them with Oyle, and wash them, and so do them great good, whereby they become as tame and gentle as men so that they want nothing but speech" (*Linschoten*, Vol. II., p. 1). This remarkable

to see it in the last of 1601 (Linschoten, Vol. II, p. 2) to any person who has seen the elephant piling great logs of timber at Moulmein, this feat of placing stones underneath the pipes of oil, &c., will not appear an overdrawn picture. The Moulmein elephants may be witnessed while at work to carefully examine if the logs lie straight and to tilt them this way or that way until parallel. In both cases, the intelligence may have proceeded, however, from the rider who, by almost imperceptible hints with his heels, knees, hands or words, commands the trained actions of the elephant. But the illustration shows the high state of elephant training that existed in India during Linschoten's time (1596)

overworked, that the offspring of domestication would be, in the 15 years necessary to rear them, both more expensive and less hardy than the captured wild stock. In the *Ain-i-Akbari* will be found much of great interest both as to the breeds of elephants, their classification, kind of work assigned to each, amount of food given, and the wages of attendants, &c. The following extract with regard to breeding may be here given—

"In former times, people did not breed elephants, and thought it unlucky, by the command of His Majesty, they now breed a very superior class of elephants, which has removed the old prejudice in the minds of men. A female elephant has generally one young one, but sometimes two. For the milk of the mother they are c
20 years old, *dirka*, when 30 years old, *kalain*. In fact, the animal changes appearance every year, and then gets a new name. When 60 years old, the elephant is full grown. The skull then looks like two halves of a ball, whilst the ears look like winnowing fans." After the above there follows a careful description of the eyes, teeth, tusks, and trunk. "An elephant is perfect when it is eight *dast* high, nine *dast* long, and ten *dast* round the belly, and along the back." "Some elephants rut in winter, some in summer, some in the rains. They are then very fierce, they pull down houses, throw down stone walls, and will lift up with their trunks a horse and its rider. But elephants differ very much in the amount of fierceness and boldness." "When they are hot a blackish discharge

Breeding.

much about the animal as we do at the present day. Even the habits of the wild elephant were fully understood. Space cannot be afforded for more than a very few other quotations from the *Ain-i-Akbari*, but the following will be of interest to naturalists.—"A herd of elephants is called in Hindi *saku*. They vary in numbers, sometimes a herd amounts to a thousand. Wild elephants are very cautious. In winter and summer, they select a proper place, and break down a whole forest near their sleeping place. For the sake of pleasure, or for food and drink, they often travel over

red discharge, after which gestation commences. During that period, they look startled, sprinkle themselves with water and earth, keep ears and tail upwards, and go rarely away from the male." The Emperor Jahāngīr (*Memoirs*, p. 130), some time after the date of the *Ain-i-Akbari*, while speaking of the period of gestation in elephants, says "During this month a female in my stables gave birth before my own eyes. I had often expressed the wish to have the time of gestation by the female elephant correctly determined. It is now certain that a female birth takes place after 16, and a male birth after 18 months, and the process is different from what it is with man, the fœtus being born with the feet foremost."

Gestation.

animals: in some they last for a few weeks, in others for even four or five months. "Elephants are not always violent or untractable under their treatment." The approach of a flood, which is so well known to the elephant, is not so much a trickles

"On the first indications the elephant is strongly secured. If he becomes dangerous his food is thrown to him and water supplied in a trough pushed within his reach." Sanderson continues: "The flow of

highly fed and lightly worked. "It has been supposed that male elephants as well as females 'come into heat,' and although they seem always prepared to pay attentions to females, there are certainly seasons when the sexual instinct in them runs higher than at others, and which may correctly be called 'rutting times.'" The male approaches the female in the rutting season.

remarkably well, the body being down in the water with the trunk carried erect for breathing. In fording shallow streams he moves cautiously, and may be trained to tramp down materials given him, to ensure a better footing. Should the ground sink underneath him he rolls over on his side to liberate his feet. It is thus recommended to send one elephant over a ford without his load in order to ascertain the nature of the shallow river bed before taking others with loads across.

LOADING.—The elephant equipment should be so constructed that the

II9

weight of the load rests on the upper part of the ribs not on the spine. Half a ton is considered a good load for an elephant intended for continuous marching. Sanderson says: "I have known a large female carry a pile of thirty bags of rice, weighing 82lb each, or 1 ton and 2 cwt., from one store room to another, three hundred yards distant, several times in a morning. By the Bengal Commissariat Code elephants are expected to carry 1,640lb, exclusive of attendants and chains, for which 300lb extra may be added; but this is too great a weight for continued marching." Captain Hood gives the following estimate for loads:—elephants 7 feet 6 inches high not to exceed 6 maunds; 8 feet 7 maunds; 9 feet 8 maunds; and 10 feet 9 maunds. This is for hilly country, and for the plains he allows to each of the above animals 2 maunds extra. An excessive load tires the animal too soon, makes the feet sore, and causes it to stumble. An average load is, therefore, equal to that which would be carried by three camels or by seven and a half mules. On the march metalled roads are to be avoided, as these soon injure the feet and render the elephant useless. On this point Steel writes: "No part of the body is more liable to disorder, and complete temporary incapacity results from injury to or disease of these important organs." Although very sure-footed, an elephant picking his way through rocky dry beds of streams, a trench or precipitous nullah is almost impassable to him owing to his inability to jump. On ascending steep banks of streams, with a load, he is liable to fall on the back, and in such cases is almost invariably killed. He is not suited for draught purposes, but has often proved most useful in extricating guns from awkward positions; in such cases, however, he more frequently shoves than draws the load. It has already been remarked that the small Nepál elephant is more suited for hill work than the Assam or South India animal.

SLEEPING.—The elephant requires very little sleep, but if disturbed in the few hours that are necessary he soon gets out of working form. There should be strict silence in the elephant camp after 9-30 p.m., and the sleeping ground, as Ouchterlony recommends, should, if possible, be on the incline, the animals being placed with the hind up hill. Unless this precaution be observed, should the animal lie down, he will most probably be unable to rise again without the aid of other two elephants. To raise him it has been recommended to give stimulants, then push him on one side and leave him to rest for a time, thereafter push him on to his legs. In rising the elephant "elevates the forehead first, and in lying he flexes the fore limb at the elbow and the hind limb at the stifle. The fore foot is bent inwards with the sole turned towards the root of the trunk, which organ lies curled upon the ground." (Steel.)

DETECTION OF AGE.—In detecting the age of elephants no difficulty is experienced with very old or very young animals; with intermediate ages, however, it is very difficult to say within a few years. Up to six or seven years the top of the ear is not turned over (as in man), but with advancing years it laps over,—in old elephants very much so, and with age, also, the margin of the ear gets torn. It is a common saying that no one has seen in the jungles the remains of a dead elephant, from which circumstance the natives believe he never dies. Sanderson and most sportsmen attach little importance to this circumstance, and affirm that it is no more to be wondered at than the rarity of finding the skeletons of other wild animals. The abundance of animals that greedily devour carcasses, when taken into consideration with the powerfully decomposing influences of the climate, are supposed to be sufficient causes for the fact of the rarity with which the bodies of wild animals are found in the forest.

STATELY BEARING.—The elephant is peculiarly suited for the stately

warfare.

processions, so much beloved by Native Princes. His graceful motion and great size give him a charm which no other animal possesses. To the sportsman he is of exceptional value, since his obedience and courage render it, comparatively speaking, safe to closely pursue the tiger and other large game, until so hard pressed that exposure to the rifle becomes a necessity. The merit of the elephant as a baggage animal, in regions with defective communication, has already been dealt with, and there thus remains only the question of his utility or otherwise in warfare. In the *Ain-i-Akbari* will be found a description of the manner in which very courageous elephants were employed by Akbar on the actual battle field. Large howdahs were constructed to carry a number of soldiers, who discharged their guns, spears, &c., on the elephant charging the enemy. We read also that the African elephant was once upon a time domesticated, and that the Carthaginians employed them as fighting animals in their wars against Rome. On the conquest of Carthage, the Romans for some time after also employed elephants, but more especially in the amphitheatre and in military pageants. Thus during the ascendancy of the Roman Empire, elephants were quite common in Europe, but they ultimately disappeared and for centuries were altogether unknown and what is more remarkable, the African elephant, since the fall of Carthage, has not been again domesticated. We read of the Indian elephants on the battle-field from the date of the wars against Alexander the Great down to modern times, but with the English army in India he is practically purely a baggage animal. In concluding an instructive chapter on the adaptability of the elephant for certain work in modern warfare, Steel summarises his arguments as follows—

"I—The elephant, as an actual weight-bearer, is most valuable

"II—He is very difficult to feed, therefore but few can be allowed to the front on service

"III—But a few are very useful there to assist guns and other heavy draught over awkward places—whether sandy, muddy, or narrow

"IV—In siege trains, for slow draught movement of heavy guns, for carriage of scaling ladders, &c., &c., elephant legitimately finds a place.

"V—At the base, and along the line of communication

can easily see

most useful for

tions of war

transport if re

vantageously

roads are fit for draught

"VI—The spread of railways and metalled roads lessens the need

for elephant transport, but in unopened jungly country the elephant is

invaluable for communication

"VII—In the absence of railways and metalled roads the elephant proves most useful for shifting

heavy guns, for moving heavy beams and other weighty articles, in throw-

ing down walls, and in various other ways.

"VIII—Once the elephant acted the part of artillery in war—break-

ing up compact masses of Infantry at once by the weight of its charge

and by the dread its appearance gave rise to. It is now used at the front

for artillery purposes only in carrying small guns, or in drawing those of

Heavy Field Batteries.

The Indian Elephant.

DISEASES TO WHICH ELEPHANTS ARE SUBJECT, AND
REMEDIAL AGENTS.DISEASES.
I22

WILD AND CAPTIVE ELEPHANTS.—Few travellers appear to have observed the wild elephant suffering from more than the natural infirmity of age. The young are always in good health. In captivity the diseases to which the animal is liable are probably all due to the sudden and complete change of life forced on him. It is often difficult to procure so large a quantity of grass as he requires, and the habit has thus to be learned of feeding on leaves of trees which, in the wild state, the animal rarely eats. In fact, with the exception of a few trees, the leaves and boughs of which are partaken of more as a relish than a regular article of diet, the elephant confines himself to eating grass. His habits are also methodical, and he rarely exposes himself to the scorching influence of the sun. At fixed intervals he drinks and bathes, at others feeds or reclines under deep and grateful shade, while his hours of sleep are equally a matter of rigid habit. All this is to a large extent disturbed by domestication. The mahout finds it easier to procure for his charge a meal of boughs of trees than of grass, and loving himself the midday heat, unless carefully watched, he will invariably start foraging late in the morning, most probably at the very hour he should be returning home with the day's supply. Sanderson says that there are two diseases to which the recently captured elephant is liable. These are the dropsical *yaarba'hd*—accumulations of water under the skin—and the wasting *yaarba'hd*, in which the animals fall gradually away to mere skin and bone. Freedom, he adds, from restraint, and liberty to graze as the animal likes, is the only cure for both these diseases. Medicine is of little or no avail.

Yaarba'hd.
I23Colds.
I24

The elephant is extremely liable to cold, and extremes of climate or too rapid changes should be avoided. Thus, for example, when on the march the elephant should be allowed half an hour's rest to cool down before he is made to swim a river if the water be cold. If this precaution be not observed the animal is very apt to acquire the troublesome disease known as *chourung*.

Chourung.
I25BLOOD.
I26

CLASSIFICATION OF DISEASES.—Steel classifies the diseases to which the elephant is subject into—**NON-SPECIFIC DISORDERS OF THE BLOOD** such as Debility, *e.g.*, *yaarba'hd* (*saarbad*), fever, rheumatism, &c. **SPECIFIC DISORDERS OF THE BLOOD**, *e.g.*, Pleuropneumonia, doubtfully obtained from the epidemic out-breaks among cattle; Dysentery or Murrain; Anthrax; Rabies, from dog bites; Foot and Mouth disease (*kultd*), Variola Elephanti, or Elephant Small-pox.

DIGESTIVE.
I27

But the elephant is also subject to many of the ordinary maladies which affect the **DIGESTIVE SYSTEM**, such as Simple Colic, Flatulent Colic, Enteritis, Diarrhœa, Dysentery, Parasites in the Alimentary Canal, Fascioliasis, and Hepatitis. Similarly, the **RESPIRATORY ORGANS** are frequently affected by the usual diseases to which man and animals are alike liable, such as Catarrh, Sore-throat, Inflammation of the lungs, and Bronchitis. Inflammation of the Kidneys, as Gilchrist pointed out, is also of fairly frequent occurrence, and amongst **NERVOUS COMPLAINTS** may be mentioned simple Phrensy after Anthrax, while Encephalitis or inflammation of the brain and its membrane often occurs, the animal becoming dangerous. Apoplexy, Tetanus, and Paralysis have been observed in certain cases.

RESPIRA-
TORY.
I28URINARY.
I29NERVOUS.
I30SKIN.
Ulcerations.
I31Sore-backs.
I32

THE SKIN, though remarkably thick, is very sensitive, insects often annoying the animal very much, while **SKIN DISEASES**, Ulcerations, Boils, &c., are frequent and dangerous, the more so since a surface cure is only too frequently effected with serious later consequences. Sanderson remarks that **SORE-BACKS** from chafing of gear are exceedingly tedious

The Indian Elephant.

margosa (*neem*, *Melia Azadiracta*) oil should be tied over the wound to prevent flies approaching it and irritating the elephant." Oliver recommends that the wound should be freely washed, and Sanderson's syringe to pump the turpentine will, he a

march SORE-HEEL is serious after the risk of injury to the back from imperfectly fitting gear. A slipper to fit over the foot is by most authors recommended to be carried in case of need, and a preparation known as *chob* is regarded as most useful in overwearing of the feet. This consists, among other ingredients, of Catechu 3lb, marking nut powder (*Anacardium*) 6 lb, Gum of *Sal* (*Shorea robusta*) 14lb, Wax 2 lb, Jaggery 6lb; Gingli oil (*Sesamum*) 6lb, &c., made into a paste and applied over the surface of the foot. Steel, in concluding his admirable account of the diseases to which the elephant is subject, gives a list of the remedies in most general use. He remarks that the doses may be said to be twice those given to the ox for corresponding maladies. The mahouts rarely prescribe purgatives, but according to Sanderson, the elephant eats earth for that purpose. Emetics, as with the horse, have no action on the elephant. In addition to the ordinary drugs in use for other animals, such as alum, chalk, sul-

I43**Amount of
per day.**I44**

But the amount of suitable green fodder which a full-grown elephant will consume in eighteen hours I have found, by numerous experiments, to be much greater than this—*viz.*, between 600 and 700lb. This is what a beast of average appetite will actually eat, excluding what it throws aside; and I have seen a large tusker eat 800lb, or 57 stone, in eighteen hours." In another passage Sanderson adds, "since representing the inadequacy of the above allowances to Government in official correspondence on the subject, I have been informed that experiments have been made in the Bengal Commissariat Department in continuation of my own, which have proved that an elephant will eat 750lb of dry sugar-cane, which is more feeding fodder than grass, per diem, and that steps are being taken to remodel the fodder scale." Steel writes: "No doubt grazing when possible is the best method of feeding, but sufficient range is not always procurable, and in the hot season grass runs short; even then, however, the branches of trees can be obtained and the leaves which constitute their hot weather foliage." Symm wrote, "my opinion is that grass should form the principal kind of green fodder all the year round, and that either on the march, or when the good kinds are not obtainable, or as a kind of variation, its use may be substituted either by banian, jack tree, peepul, bamboo, plantain leaves, fresh paddy straw, or sugar-cane. The plantain leaves I would not recommend during cold or chilly weather." Forsyth says the elephant will not of choice feed on bamboo, though the young shoots are very acceptable and nutritious. When plenty good grass can be obtained as at the beginning of the rains, the *ratib* (or rations of food) may be reduced and increased when the fodder (*cherrai*) is scanty or of poor quality. The *ratib* consists (as prescribed in the Commissariat Code) of *atta* (coarse flour) or rice of the third quality or of *dhan* (unhusked rice) in twice the amount of either *atta* or husked rice. This grain is to be cooked by baking on an iron-plate and made into cakes or *chapatis* weighing about 2lb each. Grain is also often made up with straw or leaves into small packages and placed in the elephant's mouth. He is fond of being thus fed and is a slow eater of grain otherwise, as he can only pick it up in small quantities. Much difference of opinion prevails as to whether the grain should be given cooked or uncooked. Salt and oil are also allowed to the elephant attendants, but the latter for external application only. According to the scale of rations 15lb of grain a day is allowed to each elephant, 2 ounces of salt, and 1 ounce of oil. Sanderson is opposed to giving elephants large allowances of grain, and would prefer a better quality and large quantity of fodder. He contends that the grain diet is unnatural. The wild elephant, however, regularly makes depredations on the fields, and, moreover, digs up roots and other farinaceous additions to his fodder diet. Tennent mentions, for example, the destruction of Sago-palms (*Caryota urens*) effected in Ceylon by the elephant. These palms are split open and their farinaceous pith greedily eaten. The chief difficulty appears to be in securing that the ration of grain is actually given to the elephant, since its allowance of fodder is lessened in consideration of its expensive diet of grain.

devoured, and a cooee-out when found is first rolled under foot to detach it from the husk and fibre, and then raised in the trunk and crushed, almost without an effort, by its ponderous jaws." Steel writes; "Practically, most green stuffs, grasses, and leafy branches, are acceptable to the elephant and can be utilized by him as food—much must be left to his judgment in selection on the emergencies of the march, and when the Commissariat stores run short on a campaign."

(For further information see the article FODDER.)

ELEPHANT FLESH.

FOOD.
146

Elephant flesh is much relished by certain hill tribes as an article of diet, so that in addition to its utility as a baggage animal the elephant may be said to be of value as an article of human food. Sanderson narrates a remarkable accident where two tame elephants tied to a recently captured one were all three mysteriously drowned while swimming the Kumaon river of Chitragong hill tracts. Next day the Joomas swarmed in their boats over the place where the animals sank. The carcasses soon floated on the surface and were cut to pieces, and every particle of their flesh removed. Amongst the Hindus generally a singular belief prevails as to the medicinal property of elephant flesh boiled in mustard oil. This probably from the theory of signatures, is viewed as a sovereign remedy for Barbadoes leg—the *dool-hi* of the Arabs (*dinsah*).

MEDICINAL
USES.
147

IVORY.

IVORY.
148

Reference has been made to the fact that the Ceylon elephant frequently has no tusks. In India a tuskless male is called a *mivra*. The tusks of the Asiatic species are considerably less than the African. The largest Indian tusk on record is that obtained by Sir Victor Brooke. The animal from which this was obtained had the left tusk diseased, but the right one measured (outside curve) 8 feet; length of part outside the socket or nasal bones, 5 feet 6 inches; greatest circumference 1 foot 2 1/2 inches; and weight 90 lb. Sanderson states that the largest tusks, of elephants shot by him, measured respectively 4 feet 11 inches and 5 feet in length outside curve; 16 1/2 inches in circumference at the gum; weight 74 lb the pair. "As a rule tusks show barely one half of their total length outside the jaw of the living animal. The length within and without the nasal bones is generally equal, but the lip or gum hides a few inches of the projecting half. As the sockets or nasal bones of a large elephant are from 1 foot 6 inches to 1 foot 9 inches in length, this admits of an elephant's having a tusk 3 1/2 feet long, of which 1 1/2 foot (the gum hides about 1 inches) is visible" (Sanderson). "Tusks if once lost are never renewed, and if, in cutting off the tips, too much be removed, thus endangering the hollow lower portion, the tusk is completely destroyed. One tusk is generally considerably longer than the other from the habit of the animal in using one more than the other. The Indian elephant is not hunted expressly for its ivory, and consequently the trade in Indian ivory is, comparatively speaking, limited. During the past five years the exports of Indian ivory have averaged in value from Rs14,635 to Rs73,315. India, however, imports a large quantity of African ivory, and does a considerable trade in exporting this foreign ivory to other countries. During the past five years the imports of foreign ivory have been valued at from Rs10,011.55 (the lowest annual valuation) to Rs1,21,561. The re-exports of this foreign ivory during that period have averaged from Rs46,161 to Rs1,21,671. The traffic in this foreign ivory is mainly concentrated in Bombay, the supply coming from Zanzibar and the East Coast of Africa. The exports of Indian ivory are almost exclusively from Bengal and Burma. The

Habitat.—A large perennial herb, with a thick fleshy or woody rhizome, from the upper part of which are given off the horizontally spreading, flowering, and fruiting stems. It is indigenous in West and South India, growing abundantly in the rich moist forests of the hilly tracts of Kánara, Mysore, Coorg, Travancore, and Madura. Mr. Ludlow mentions it as "a native of the hilly parts of Cochin China, Travancore, Malabar, Coorg, Munjerabad, and Nugur. It is extensively cultivated in many other parts of South India, at elevations from 2,500 feet to 5,000 feet. It grows wild also in many parts of Burma, and in the Bhamo District is said to be cultivated in sufficient quantity for local consumption.

HISTORY.
152

HISTORIC NOTE.—It is worth mentioning in this place that *Linschoten*, in the *Journal of his Indian Travels* (*Published in 1596*), describes two forms of Cardamoms as used in South India. These he calls the Lesser and the Greater Cardamom. It would thus seem that 300 years ago, as at the present day, the Nepál Cardamom was carried all over India. Cardamom is in Sanskrit known as *Ela*, and is mentioned by *Susruta*, so that it must have been used by the Hindus from a very remote period. The early Arabian writers were acquainted with it, and the more recent Muhammadan authors speak of the Cardamom under the names of *Kakulah* and *Hil*. Dr. Dymock, referring to the first European knowledge of Cardamoms, says—"When they were first introduced into Europe is doubtful, as their identity with the *Amomum* and *Cardamomum* of the Greeks and Romans cannot be proved. Garcia thinks that the *Amomum* of the ancients was the *Hamama* of the Arabs, a drug still to be found in the Bombay shops, and which appears to be a species of *Sphagnum*: it is figured by *Clusius*." Muhammad Hussain gives *kátidáús* as the Greek, and *sharfíyún* and *shusma* as the Syrian names for the Cardamom. He describes two forms—the large and the small. Of the Lesser Cardamom *Linschoten* wrote that "it most groweth in Calicut and Cananor, places on the coast of Malabar." Commenting on *Linschoten's* account of this spice, his contemporary, Dr. *Paludanus*, wrote that, according to *Avicenna*, there are two kinds of Cardamoms—the Greater and the Lesser. He then adds that to the ancient Greeks such as "Galen, *Dioscorides*, and others, it was unknown: and although Galen, in his *seventh book* of simples, saith that Cardamomum is not so hot as *Nasturcium* or watercresses, but pleasanter of savour and smell with some small bitterness, yet those signes or properties doe not agree with the Cardamomum of India. *Dioscorides* in his first booke and fifth Chapter commending the Cardamomum brought out of Armenia and Bosphorus (although hee saith also that such doe growe in India and Arabia) saith that we must choose that which is full, and tough in breaking, sharp and bitter of taste, and the smell thereof causeth a heavinesse in a man's head: yet is the Indian Cardamomum caryed into these places from whence *Dioscorides* affirmeth that his Cardamomum doeth come although it be neither tough in breaking nor annoyeth the head, neyther is bitter of taste nor so sharp as cloves." Thus *Paludanus* held the opinion that has since become current in the literature of the subject that the *Amomum* and *Cardamomum* of the ancient Greeks was not the spice of India.

CULTIVATION.

are planted out, either singly or in twos, under the shade of the large trees. They take five years before they bear fruit; 'in October,' remarks our informant, 'I saw the plants in full flower and also in fruit, the latter not however ripe.' In North Cánara and Western Mysore the cardamom is cultivated in the betel-nut plantations. The plants, which are raised from seed, are planted between the palms, from which and from plantains, they derive a certain amount of shade. They are said to produce fruit in their third year; cardamoms begin to ripen in October, and the gathering continues during dry weather for two or three months. All the fruits on a scape do not become ripe at the same time, yet too generally the whole scape is gathered at once and dried, to the manifest detriment of the drug. This is done partly to save the fruit from being eaten by snakes, frogs, and squirrels, and partly to avoid the capsules splitting, which they do when quite mature. In some plantations, however, the cardamoms are gathered in a more reasonable fashion. As they are collected the fruits are carried to the houses, laid out for a few days on mats, then stripped from their scapes, and the drying completed by a gentle fire heat. In Coorg the fruit is stripped from the scape before drying, and the drying is sometimes effected wholly by sun heat. In the Native States of Cochin and Travancore cardamoms are a monopoly of the respective Governments. The Raja of the latter State requires that all the produce shall be sold to his officials, who forward it to the main depot at Alapalli or Aleppi, a port in Travancore, where his commercial agent resides." "The cardamoms at Aleppi are sold by auction, and bought chiefly by Moplah merchants for transport to different parts of India, and also, through third parties, to England. All the lower qualities are consumed in India, and the finer alone shipped to Europe. In the forests belonging to the British Government cardamoms are mostly reckoned among the miscellaneous items of produce; but in Coorg, the cardamom forests are now let at a rental of £3,000 per annum under a lease which will expire in 1878. Dr. Oleghorn, late Conservator of Forests in the Madras Presidency, observes in a letter to one of us, that the rapid extension of coffee culture along the slopes of the Malabar Mountains has tended to lessen the production of cardamoms and has encroached considerably upon the area of their indigenous growth. A recent writer has shown from his own experience that the cultivation of the cardamom is a branch of industry worthy the attention of Europeans, and has given many valuable details for insuring successful results."

Cochin and
Travancore.

MYSOORE.
155

Mysore and Coorg.—*Rice's Gazetteer* (I., 124) gives the following description which will be found to amplify the facts narrated in the above passage:—

"Cardamoms are propagated entirely by cuttings of the root, and spread in clumps exactly like the plantain tree. In the month following the autumnal equinox, a cluster of from three to five stems, with the roots adhering, are separated from a bunch, and planted in the same row, one between every two areca nut palms, in the spot from whence a plantain tree has been removed. The ground around the cardamom is manured with *nelli* (*Embllica*) leaves. In the third year, about the autumnal equinox, it produces fruit. The capsules are gathered as they ripen, and are dried four days on a mat, which, during the day, is supported by four sticks, and exposed to the sun, but at night is taken into the house. They are then fit for sale. Whenever the whole fruit has been removed, the plants are raised, and, all the superfluous stems and roots having been separated, they are set again; but care is taken never to set a plant in the spot from whence it was raised, a change in this respect being considered as necessary. Next year these plants give no fruit, but in the year following, yield

The Lesser Cardamom.

(G. Watt.)

ELETTARIA
Cardamomum.

capsules again as at first. After transplantation, the old stems die, and new ones spring from the roots. Each cluster produces from a quarter to one seer weight of cardamoms."

The Collector of the Madura District reports, in a recent communication, that the seeds are there sown from the beginning of July to the end of

The Lesser Cardamom.

CULTIVA- TION.

of all undergrowth and the seed sown before the monsoon. In October, when the young cardamoms sprout up, it is necessary to thin them out where they are too much crowded and where the ground is sparsely grown it should be sown with seed. For two years nothing more is to be done. In the third year the plantation should be weeded and the small crop gathered. In the fourth year the garden should be thoroughly weeded, and as it is, by this time, in full bearing, a close attention should be paid to it. "Cardamoms require light showery weather in March and April, when the flowering scapes are ready to blossom, and the absence of this at the proper time almost ruins the crop." Cardamoms ripen in November and are liable to be damaged by rats, snakes, and vermin of every description.

The scapes with the cardamoms are removed from plants; the capsules are then carefully removed from the scapes and dried on the rocks. The fruits soon lose their green colour and are then ready for the market.

The fruit sells at the coast at R4 per lb (Dutch), but the grower gets only a third of this.

A little care on the part of the Travancore authorities has brought up the total produce to 1,500 cwt., which was formerly only a few cwt.

"Roughly estimated, about 20,000 acres were under cultivation, and there is land available for extending the cultivation five-fold.

The yield per acre in even favourable time does not exceed 20 to 25 lb of cardamoms."

BOMBAY. 159

Bombay.—The following special report has been furnished, for the present work, by the Officiating Director of Land Records and Agriculture:—

Cardamoms are grown in Kánara only. In 1887-88 that crop occupied 899 acres. It is common in the hill gardens of North Kánara. It requires plenty water. In a new garden, Cardamoms are grown from seed, and in an old one from cuttings. The seed is sown in October after the outer shell is removed. It must be carefully sheltered from the sun, and it takes three months to sprout. When the seedlings are a foot high, they are transplanted, and a year and a half later they are set in shady places among betel-palms, and begin to bear when three years old. In Sirsi about 1,000 seedlings go to an acre, while in Yellapur the number of seedlings required to plant an acre of land is 650. The pods commence ripening in September and October, and are gathered till the end of February or the beginning of March. There are about 17 pickings, more than half the pickings having an interval of a week between them, while the rest from a fortnight to three weeks. The acre yield varies from 7 to 28 lb. The pods, after they are dug out of the ground, are dried four days on a mat, which, during the day, is hung in the sun, and at night is taken into the house. The pods are then fit for sale. When the whole crop has been picked, the plant is taken out of the ground, the useless wood and roots are cleared away, and it is again planted in a fresh hole. The year after it has been moved, the plant yields no fruit, but in the following year it again bears. After the plant has been removed, the old stem dies and a new stem springs from the root.

Cost of cultivation; yield, &c.

As Cardamom is never grown by itself it is very difficult to ascertain accurately the cost of cultivation. As a rule, it is grown in spice gardens containing betel-nut palms, betel and pepper vines, and plantains. In an experiment conducted in a good specimen of the highest class of spice garden in full bearing, Mr. J. H. Todd, C.S., estimated the cost of cultivation per acre at R97. To this must be added R15, being a moiety of wages for watching, weeding, and taking care of the garden. Thus the amount of charges per acre comes to R135. By the same experiment the value of produce—114 lb—comes to R326. Mr. Todd's details of the

ELETTARIA

CULTIVATION.

water is drained off, the washed cardamoms are thrown on to a mat. The heap becomes large after a few hours' work. A woman is exclusively in charge of it and continually sprinkles the well-water over it. She is relieved at night by another woman, who sprinkles the heap till morning, once every half hour.

Bleaching.

"Next day when the sun has risen, the heap is carried to the flat roof of the house, and the cardamoms are spread on mats for four or five hours to dry. The next operation is to nip off the short stalks. This is done by women sitting in the house. Each woman has a large pair of English scissors. She squats on the floor and rests her right hand which holds the scissors on the floor, and feeds the scissors with her left hand. The pace at which this nipping is done astonished me. The stalk is very small and care must be taken to cut it off without injury to the cardamom itself. I saw an old woman nip 90 cardamoms in one minute.

"This done, the sorting begins. The small ill-shapen cardamoms are separated, and only the well-rounded ones packed for export to distant markets. A woman sorts a *man* per diem.

"I must now return to the first washing. The mixture in the tub, after the first basketful has been baled out, is replenished by two or three quarts of the well-water and a second basketful washed. The tub is then emptied and a fresh mixture made. The mixture for the second washing also does duty for two basketfuls. The women who wash the cardamoms are paid 3 annas per diem. An ordinary wage is $1\frac{1}{2}$ to 2 annas. The night-watcher receives 4 annas. The nipping is paid for by the piece at the rate of $\frac{1}{2}$ anna per *padi* (10 *padis* = 1 *man* = 26 lb). It is said that an expert can earn $2\frac{1}{2}$ annas per diem. She must clip 13 lb therefore; all other hands employed are paid by the day at 2 annas."

Starching.

"Besides this bleaching now-a-days cardamoms are starched. Starching was first introduced at Sirsi, where bleachers had recourse to it as they had to compete with the bleachers at Haveri, who were experts in the art of bleaching, and who had established their fame as such. The starched cardamoms look whiter than the ordinary bleached cardamoms of Haveri; and the bleachers of Haveri have therefore now taken to starching. The starch is prepared by pounding together rice, wheat, and country soap with butter milk. The paste is dissolved in a sufficient quantity of water, and the solution is sprinkled over the cardamoms to be starched as they are being rubbed by the hand."

It may be worth adding in connection with North Kánara, that Mr. Talbot, in his interesting paper on the trees and shrubs of that district, makes no mention of the wild cardamom, from which circumstance it may be inferred as not indigenous. In the *Bombay Gazetteers* brief notices are given regarding the cardamom. Of Khandesh it is said to be grown in sufficient quantity to meet local demand, but that there is no export. It is also mentioned as one of the thirteen spices which are grown in Kolhapur.

AREA OF CULTIVATION, PRICES, &c.

AREA.

160

The total area under cardamoms cannot be definitely determined, though it may be affirmed that the crop is chiefly raised in the portion of the mountainous tract of the southern or south-western extremity of India. The chief districts in the Madras Presidency and the areas under the crop during the past three years were Madura (1885-86, 1,200 acres; 1886-87, 1,000 acres, and 1887-88, 1,800 acres); South Canara (1885-86, 1,000 acres, 1886-87, 1,800 acres, and 1887-88, 1,400 acres); and Malabar (1885-86, 1,500 acres, 1886-87, 1,800 acres, and 1887-88, 2,000 acres). In Mysore, cardamoms are mainly grown in the Kadur District, the area under the crop having, in the corresponding years to the above, been 1,600, 2,300, and

Cardamomum

2,200 acres. In Coorg the crop rarely occupies much over 300 acres. Thus, in Southern India, according to the published statistics, there were 7,700 acres in 1837-38 and 5,590 acres in 1885-86. According to these returns the area under cardamoms has increased, while it will be found the foreign exports have decreased, but the imports greatly increased. There are many other features of the cardamom trade which appear contradictory, so that in compiling from existing literature, it is difficult to decide the course to be pursued. It is hoped, therefore, that this admission may

The Lesser Cardamom: The Makri Millet.

TRADE.

countries are generally in the following order of importance:—Arabia, Germany, Aden, and Persia. On the other hand, the *imports* of Foreign Cardamoms seem to be on the ascendant. In 1880-81 they were valued at R4,154, and taking the same years as have been given for the exports, these imports were in 1883-84, R18,351; 1885-86, R32,205; and 1887-88, R2,60,450. During the last mentioned year the bulk of the imports (*viz.*, R2,51,211 worth) came from Ceylon, and of the total of these foreign imports. Bombay received R2,16,455 worth. The coast-wise imports and exports (*e.g.*, the inter-provincial trade by sea) were valued at over 10 lakhs of rupees, so that, excluding the trans-frontier trade by land and the railway, road, and river-borne transactions (the exact figures for which cannot be discovered), the total Indian trade in cardamoms was last year valued at R25,11,053. But it must be added that it is not known how much of these figures of Indian trade in cardamoms relate to the Greater or Nepál Cardamom (see *Amomum subulatum*), though, of course, the bulk of the transactions, especially in South India and Ceylon, must be in the Lesser Cardamom, the fruits of the plant presently under consideration.

OIL.
163

Oil.—An essential OIL is extracted by aqueous distillation. It is of a pale yellow colour, about 5 per cent. being generally obtained; it possesses the flavour and odour of Cardamoms, and is said to be distilled to some extent in Madras.

MEDICINE.
Seeds.
164

Medicine.—The SEEDS are agreeably aromatic, but their chief medicinal use is as an ingredient in compound preparations. "They are used as a corrective for foul breath. Finely powdered they are administered as a snuff for headache. The cardamoms, fried and mixed with mastiche and milk, are employed internally in irritation of the bladder. In nausea and vomiting they are used as a *sherbat* with pomegranate, and in cholera they are resorted to as a stimulant" (*Dr. Emerson*). As the seeds rapidly deteriorate on exposure, they should not be removed from the capsules until required for use.

SPECIAL OPINION.—§ "Carminative, employed with other aromatic drugs." (*Assistant Surgeon Sibb Chandra Bhattacharji, Chanda, Central Provinces*).

FOOD.
165

Food.—Cardamoms are used by the natives in flavouring sweetmeats and certain cooked dishes; also as a spice, and are sometimes chewed in *pén* with betel-leaf.

Illustrations, and special report by Collector, Madras, Hunter, Orissa, II, App. IV, 133; Set. Rep, Bareilly, 1874, 68, U C Duth, 268, 314

Habitat—A tall annual grass; stems many, erect or decumbent at the base, and somewhat compressed. At the summit of each stem are four to six digitate, and usually incurved spikes. It is largely cultivated as a rainy-season crop, and in many parts of India its grain constitutes the staple food of the poorer classes. It is affirmed that the grain is never attacked by insects, and will accordingly keep for any length of time.

History.—The facts stated by DeCandolle, in his *Origin of Cult Pl*, indicate a probable Indian origin for this millet. In Egypt the

DISTRICTS.
174

to the cultivated *E. Coracana*.

Varieties.—There are several so-called varieties of this plant, which differ chiefly according to their requirements as to soil and time of sowing. Under the name of *E. stricta*, Roxburgh has described the form which has the spikes quite straight. This kind requires a richer soil, and is often surprisingly productive.

CULTIVATION.

As this millet is cultivated over the greater part of India, it will be necessary to describe briefly the mode of growing it in certain typical regions.

1. *Himalayan Districts*—Mr. Atkinson says: "It is the staple autumn crop of the highlands (up to 8,000 feet) between the Tons and the Sirsa, and forms the main food-resource of the agricultural classes. It

ELEUSINE
Coracana.

The Marua or Ragi Millet.

CULTIVA-
TION

gives a larger yield than other crops, and is said to increase in bulk when ground, qualities that have probably led to its more general cultivation, as it is a poor and very coarse grain." "*Mandua* is cultivated both in ordinary agricultural land and in freshly-cleared jungle. In ordinary land, it usually follows a wheat crop, which is gathered in April-May, and the land is at once prepared for the *mandua* in the same manner as for rice. The seed is sown broadcast, and instead of a harrow, the bough of a tree is drawn over the newly-sown land to cover the grain. When the young plants have risen two or three inches, the whole field is harrowed two or three times, and the vacant spaces are filled up from those where the plants are in excess." "Later on the crop is well weeded with the *kēṭāl*, and in October-November the ears of the *mandua* are cut off." It is generally sown as a mixed crop along with pulses, &c., known collectively as *kān*.

PANJAB.
175

2. *Panjab*.—"In the Karnāl District it is grown in fairly stiff soil, but chiefly in the Khādar, and then only in small quantities. It is sown in seed beds carefully dressed and manured. The seedlings are then planted out in land which has been twice ploughed, and dressed with the *sohāggā*. It is watered once, or twice if the rains are late, and weeded once. The heads ripen slowly, and the ripe heads are picked off, and the grain beaten out In dry seasons its cultivation as a food crop is largely increased, it being put in fields intended for *zīrī*, which cannot be planted out owing to the drought" (*Gaz., Karnāl Dist., 178*). In the Kangra District it forms an import.

N. W. PROV-
INCES.

3. *North-Western Provinces and Oudh*.—"It is cultivated under two very different circumstances in these provinces. The most important position it fills is that of the chief food-grain of the hill tracts on their northern border, where it is very extensively cultivated. In Jaunsār Bāwar it forms the chief article of food of the hill-men, and is grown on the very poorest soil, often yielding a crop from mere stones and shingle. It is, on the other hand, very rarely grown in the hilly country to the south of the Provinces, where its place is taken by *kodon*. But it is grown to a greater or less extent over the whole of these Provinces, and in the more fertile districts its cultivation is often attended with considerable care, and results in a very large weight of produce. It prefers light soils, and is sown at the commencement of the rains, at the rate of 10lb of seeds to the acre. In the Allahabad and Azamgarh Districts, it is reported to be occasionally sown in seed beds and transplanted like rice. In this case the seed is sown with irrigation in May, and the seedlings are planted out when the rains break. It suffers greatly from heavy rain, and a good year for rice is a bad year for *mandua*, and *vice versa*. It should be weeded two or three times, and when carefully cultivated, often receives a top dressing of manure after the first weeding. The yield is the heaviest of any of the minor millets, since not only is the gross weight of the produce large, but only a small proportion of this weight consists of husk. In this respect *mandua* is the most profitable of the minor millets. With *sawan* and *kodon*, for instance, the husk contributes almost 50 per cent. of the weight, while with *mandua* it only amounts to 4 or 5 per cent. Where carefully cultivated 12 to 14 maunds of grain may be expected to the acre, but in the hills a much smaller produce than this is gathered, and cultivators would be content with 5 or 6 maunds" (*Duthie and Fuller*).

MADRAS.
177

4. *Madras*.—"In the Coimbatore District it is sown in nurseries and transplanted, when a few weeks old, to the fields. It is, however, best known as a garden crop, and is sown generally in June or July; in some localities it is a cold weather, in others a hot weather, crop. It is usually

The Marna or Ragi Millet. (F. F. Duthie)

ELEUSINE
Coracana.CULTIVA-
TION.

MADRAS

prepared by ploughing and manuring, and the seed is sown broadcast with lines of castor, dholl, &c, in furrows at 10 or 12 feet apart, at about a month old it is interploughed and weeded. The ragi is harvested about four months after sowing, and the dholl a month or two afterwards. Threshing is performed after it has been heaped to sweat, when the grain becomes looser in the husk and is easily trodden out. It is reaped

l it is
of the
wings
Feb.

usually the cost of cultivation is estimated at Rs 10-8, the outturn at Rs 18-12. It is often grown by irrigation, and is suitable for any soil. The millet is used as food, being prepared either as a cake with water or powdered and boiled.

Ragi yields a valuable food-grain under moderate irrigation. It is easily grown and is extensively raised under wells during the hot season, being planted out from seed beds. The best plan is to ridge up the land as is done for maize and cotton, and to plant the seedlings on both sides of the ridges. The crop is a difficult and expensive one to harvest, owing to the ears never ripening at one time, and it is also costly to thresh, the grain adhering with great persistency to the panicle (*Saidapet Experimental Farm Manual and Guide*).

In the Trichinopoly District there were 153,614 acres under ragi cultivation in 1888. The crop is sown from May to August, and harvested from September to December. In dry lands the annual outturn amounts to the value of Rs 9, the cost of cultivation being Rs 4-8, and the profit Rs 4-8. In wet lands the yield attains to the value of Rs 14, the cost of

middle of August. Sheep are then penned on the land for manure, and it is ploughed five or six times, till the soil is reduced to a fine consistency. It is sown between the middle of August and the end of October. It is weeded after twenty or thirty days, and a second time after sixty days. The crop is harvested from the latter part of December to the middle of January.

MYLOL.

CULTIVA-
TION.

January) and give it a little dung. Divide it into squares, and let it have some more manure. Then sow the seed very thick; cover it with dung, and give it water, which must be repeated once in three days. The ground into which it is to be transplanted is, in Pushya, ploughed five times, and must be dunged and divided into squares with proper channels, like a poppy garden. About the end of January, water the seedlings well, and pull them up by the roots, tie them in bundles and put them in water. Then reduce to mud the ground into which they are to be transplanted, and place the young *ragi* in it, with four inches distance between each plant. Next day water, and every third day for a month this must be repeated. Then weed with a small hoe, and water once in four days. It ripens in three months from the time when the seed was sown; and in a middling crop produces twenty-fold. It is only sown on the ground at times when no other crop could be procured, as the expense of cultivation nearly equals the value of the crop" (*Gas. of Mysore and Coorg*, I., 81).

BOMBAY.
179

6. *Bombay*.—It is grown in the hill lands of the Násik District, sometimes under the wood-ash (*dalhi*) system. The seed is sown in burnt beds in the latter part of May, the seedlings are planted out in June or July, and the crop is reaped in October. It is widely grown in the hill forest country of Kánara, and the grain is generally eaten by the poorer classes. It is the principal crop on the hill lands of the Thána District, and is always cultivated as a first crop after a fallow. About twelve varieties are recognized, half of them early-ripening and the rest are late-ripening. The former are ripe in September and the latter in October. The crop is similarly treated and holds an important position amongst the food-grains in many other parts of the Presidency.

AREA UNDER ELEUSINE.

AREA.

The total area for all India cannot be ascertained, but the following are the areas returned as under the crop in Madras and Bombay for 1887-88 :—Madras 1,551,000 acres; Bombay 802,000 acres.

CHEMISTRY.
180

Chemical Analysis of the Grain.—The following is the composition of *ragi* grain according to Professor Church :—

	In 100 parts.		In 1lb.	
	Husked.	Whole.	2 oz.	o grains.
Water	13.2	12.5	0 "	413 "
Albuminoids	7.3	5.9	11 "	409 "
Starch	73.2	74.6	0 "	56 "
Oil	1.5	0.8	0 "	252 "
Fibre	2.5	3.6	0 "	182 "
Ash	2.3	2.6		

The nutrient ratio is here 1 : 13, the nutrient value 84. The percentage of phosphoric acid in the whole grain is about 0.4 (*Food Grains of India*, p. 89).

Food.—Though eaten largely by the labouring and poorer classes of people in many parts of India, it is not considered to be very wholesome, being somewhat difficult of digestion. In Mysore the flour is dressed either in the form of a pudding, or is made into cakes fried in oil.

SPECIAL OPINION.—§ "It forms the food of four-fifths of the people of Mysore, and is largely eaten by the working classes in Southern India. It enters into jail diet. It is a highly nourishing millet, suited to working men. It sometimes produces diarrhoea, but this is due to bad grinding and non-separation of the coarse coating of the grain" (*Surgeon General W. R. Cornish, F.R.C.S., C.I.E., Madras*).

Fodder.—The STRAW is considered excellent fodder for cattle, and is said to improve by keeping. In the Mysore District cattle thrive and

The Bayabirang, a useful Anthelmintic. (J. F. Duthie.)

EMBELIA
robusta.

Medicine. — According to Susruta the seeds of the plant have been described as anthelmintic, alterative, and tonic. Later writers (Dr U. O. Dutt informs us) recommend it as a carminative, stomachic, and anthelmintic medicine. In the special report from Hazara (quoted above), it is stated that "the berries are prescribed by Hakims in affections of the kidney, they are viewed as a perfect anthelmintic. Dose 6½ drachms of very finely powdered and previously shelled berries being given in a cup full of butter milk taken on an empty stomach, the first thing in the morning." Many authors allude to them as entering into the composition of several skin diseases. Royle says that they "ymock, that it is a common practice to put a few berries of the *vairarang* plant in the milk that is given to young children, they are supposed to

Fibre.—According to Dr. Thwaites the tough BARK of this plant is used in Ceylon for cordage and ropes.

Oil.—An OIL is said to be expressed from the SEEDS, the properties of which are not known.

Medicine.—A preparation from the SEEDS is used in pains of the loins and also in debility. Dr. Dymock remarks that “the properties of the seeds do not appear to have been tested in European practice ; among the natives they have the reputation of being emetic.” Dr. Mason says that in Burma they are, in native *Materia Medica*, used as a febrifuge. Along with the seeds of several other leguminous plants they are often found mixed with Calabar beans in consignments exported from tropical Africa, and all are known to the natives under the name of ‘garbee’ beans. An infusion of the spongy FIBRES of the stem is said to be used with advantage for various affections of the skin in the Philippines (*Dalz. & Gibs., Bomb. Fl., 84*).

SPECIAL OPINIONS.—§ “The kernels of the seeds are used by the natives as stomachic, carminative, and anodyne, in cases of recent confinement. The drug is said to excite appetite, check fever, relieve pain, and regulate the functions of the chylopoietic viscera” (*Civil Surgeon J. H. Thornton, B.A., M.B., Monghyr*). “Powdered kernel mixed with some few spices, is commonly taken by native women for some days immediately after delivery, for allaying the bodily pains and warding off cold” (*Assistant Surgeon Anund Chunder Mookherji, Noakhally*).

Food.—The PODS contain large, flat, hard, polished, chestnut-coloured seeds, or rather nuts, which, on being steeped in water and afterwards roasted, are sometimes eaten by the natives.

Domestic Uses.—Birdwood mentions that the pods, which are often as much as 4 feet in length, are used by the police in the West Indies. According to Dr. Thwaites the juice of the leaves is employed in Ceylon for stupefying fish. The large ornamental seeds are frequently made into snuff boxes, match-boxes, &c. ; and Royle alludes to the fact that the Nepalese make use of a preparation from them as a hair-wash. The most general use, however, to which these seeds are applied, is for crimping linen. Dr. Bonavia, writing from Etáwa, contributed the following account of the process of employment, to the Transactions of the Agricultural Society, Calcutta :—

“Dhobis up here, and probably also, down in Bengal, use a curious kind of nut for crimping linen, without using any crimping irons. This nut they call in Oudh ‘Gelha,’ and here ‘Chian,’ the latter means a seed. They say it is brought from Bengal and sold in Cawnpore. . . The Dhobis cut one side, and scoop out the kernel ; then they introduce two fingers into the cavity, and quickly stroke the damp linen forwards with its polished surface. This crimps it beautifully crossways.”

EPHEDRA, Linn. ; Gen. Pl., III., 418.

(George Watt.)

A genus of erect or sub-scandent rigid shrubs, comprising some eight or ten species (or, according to certain authors, three times that number) ; met with in Europe, temperate Asia, and South America. The EPHEDRÆ belong to the natural order GNETACEÆ—a family closely allied to the CONIFERÆ. They have opposite or fascicled, terete, striate, jointed, branches ; also opposite scales at the joints, and in the axils of these occur solitary or fascicled minute cones. The flowers are uni-sexual, and the plants often even dioecious. On this account it is probable the males and females have been described as different species ; and, moreover, they are extremely variable plants, being much influenced by soil and humidity. In India one species only can be said to occur throughout the Himaláya, viz. *E. vulgaris*, Rich. (= *E. Gerardiana*, Walt.) ; but this is also distributed to Central and Western Asia and to Europe. The other two Indian

(G Watt)

EPHEDRA.

HISTORY.
227

Interest has recently been taken in these curious plants from the observation that the dried twigs of an Ephedra imported from Persia into Bombay constitute the sacred *Homa* of the Parsis. A sample of the *Homa* obtained in Bombay was at first determined as *Penelopea aphylla*—an erect, leafless perennial, with twigs as thick as a goose-quill or less, and possessing a milky sap. Subsequent examination of other samples, however, revealed the fact that the *Homa* of the Parsis was in reality an Ephedra, which received support from the botanical report in connection with it, where it is stated Ephedra grows in the valley, the names of *Homa*, *huma*, *yehma*. Dr. Aitchison states of that plant that it was found "a

grape had in the worship of Bacchus. The question has often been discussed, what kind of plant this *Soma* could have been? When *Soma* sacrifices are performed at present, it is confessed that the real *Soma* can no longer be procured, and that some *Ci-prés*, such as *Putikás*, &c, must be used instead. Dr. Haug, who was present at one of these sacrifices and was allowed to taste the juice, had to confess that it was extremely nasty and not at all exhilarating. Even in the earliest liturgical works, in the *Sûtras* and *Brâhmanas*, the same admission is made, namely, that the true *Soma* is very difficult to be procured, and that substitutes may be used instead. When it was procured, it is said that it

Oriental Society an account of the plant. "After describing the peculiar rules for buying and rebuying the *Soma* from northern barbarians, as

sour, without leaves, milk produces vomiting, and in the opinion of Sir J. Temma, which alone, of a and milky; but I remarked at the same time that the fact of this *Sarcostemma* growing in the Presidency of Bombay militated against this identification, because the true *Soma* must be a northern plant, which was replaced in India itself by *Putikás* or similar substitutes.

EPHEDRA.

The Soma.

HISTORY.

I cannot vouch for the exact age of the *Ayur-veda*, but I doubt whether we shall find any scientific description of the *Soma* of an earlier date."

Since, however, it is stated in the *Sâtras* and *Brâhmanas* that substitutes at even that early period had to be used, may it not be that the description in the *Ayur-veda* is the description of the best known substitute? *Sarcostemma* would be difficult to procure in most parts of this country; it would, in fact, have to be imported from the Deccan to Upper and Northern India. The description, however, would agree admirably with that of a *Sarcostemma*. Assuming the determination correct the substitutes for it—the *Pâtik*—one of which was the *Pai-sak* (*Basella*) would, when deprived of their leaves, closely resemble the twigs of *Sarcostemma*. Added to all this we have the fact that Roxburgh calls *Sarcostemma brevistigma* the *Soma lulu* (or *Soma-climber*), and says of it that it has so much milky juice of a mild nature "that native travellers often suck the tender shoots to allay their thirst." Mr. Duthie gives the name *Soma* to the grass *Setaria glauca*; and a very large number of other plants in the various dialects of India have names like *Soma* or *Homa*. For example, *Veronica anthelmintica* is, in Hindûstani, known as *Soma-raj*; so also is *Pæderia fœtida*. A creeper with fleshy stems and milky sap, however, must of necessity almost, be a member of the *ASCLEPIADEÆ* or of the *LYTHORRHIACEÆ*. Some of the species of *Ephedra* are sub-scandent, leafless shrubs, but they have not got a milky sap; and far from being likely to cause vomiting when taken, they are pleasant in flavour and not unlike the hops of Europe. But the twigs of *Sarcostemma* are certainly not dark, but rather of a delicate succulent green colour. They might turn black when removed from the plant in the form ready for export, but would only do so when the whole of the milky sap had been dried up. The word "dark" would, however, be perfectly applicable to the brownish twigs of the leafless shrub *Periploca aphylla*. That plant has a milky sap, and Dr. Aitchison informs us that in Northern Baluchistan it is known as *Um* or *Uma*. Of *Periploca hydaspidis*, *Falc.* (which Aitchison collected at Jelumai near Shinak), he wrote—"it is quite impossible to distinguish it, as it grows, from *Ephedra ciliata*, *Fisch. & Mey.*" A wild species of grape vine is in Kashmir known as *Um* or *Umbur*, and in most of the languages of India the imported grapes, brought into this country are known as *Angûr*, a Persian name. Its Sanskrit name is *Draksha*. A grape grown in Europe and Australia is known as "the Kashmir."

Thus it would appear that the evidence derived from modern vernacular names largely breaks down. Dr. Dymock, at the writer's suggestion, examined the *Homa* plant used in Bombay by the Parsis, and pronounced it to be *Periploca aphylla*. A sample was afterwards sent to Kew, and Mr. W. T. Thiselton Dyer wrote that "the *Homa* of the Parsis is undoubtedly *Ephedra vulgaris*." Acting on this assurance the writer, through the kindness of Dr. Dymock, had a sample of *Ephedra vulgaris* chemically analysed, with the result that the opinion he formerly advanced seemed to be confirmed, *viz.*, that it afforded a bitter principle which might have been employed much after the same manner as hops are used in Europe and *Acacia* bark in India, *e.g.*, as a bitter adjunct in the preparation of an alcoholic beverage similar to beer or to the Angami Naga *Zû* from rice. It would now, however, appear from a renewed study of the facts since brought to light, that *Periploca* may have an even stronger claim to consideration than *Ephedra*. It seems probable that both plants are used by the Parsis, and assuming that the names *Homa* and *Soma* referred to one and the same thing originally, it may be worth while suggesting that a chemical analysis of *Periploca* should be made in order to determine if it affords, like *Ephedra*, a harmless bitter principle. It is a

HISTORY,

to make their liquor specially intoxicating; and it is said that even from the milky juice of *Calotropis gigantea* (the *Ak*, *ākanda* in Bengal; the *Ushar*, in Arabic; *Khark* in Persian, and the *Arka*, *alarka* of Sanskrit) an alcoholic beverage may be prepared. Since most writers hold that the long grapes of Afghanistan, which might not inaptly be compared to the joints of the human fingers, cannot be admissible, the final conclusion which the writer has come to regarding the so-called *Soma* plant of the ancient Vedic literature is, that it would be safer to view the references to that plant as indicating an early discovery of the art of fermentation* than to seek to establish any special and peculiar plant which may have been first so used. The disappearance of all knowledge in any such special plant (the first fermenting agent), might on this hypothesis be attributed to the discovery of better and easier processes both in the original home of the *Soma* and in the country of Aryan adoption, until the practice lost its sacred associations in the prevalent use of the substitutes. The sacerdotal injunctions might have survived for a time, and substitutes which resembled but possessed none of the properties of the original *Soma* might easily be supposed to have been used by the priesthood, while the art of fermentation became a domestic industry.

Some short time ago, the writer published a few notes on the subject of the *Soma* plant, suggested on reading Professor R. von Roth's paper in the German Oriental Society's Journal for 1884. He instituted a correspondence on *Soma* with certain eminent scholars, and a few of their replies may appropriately be here reproduced. These will be found to support the main contention advanced above that the *Soma* was an adjunct in the preparation of the beverage of the ancient Aryans, but did not itself afford a sweet exhilarating fluid.

Dr. Dymock wrote: "On looking over the *Zend Avesta*," &c., &c., "it appears to me that the *Homa* or *Soma* was not used to obtain liquor from its juice, but that only a small portion of it was added to liquor obtained from grain. The Parsi priests say that the *Homa* never decays, and they always keep it for a considerable time before they use it." It may therefore be remarked—if the *Homa* and *Soma* are the same thing, this fact is utterly at variance with Dr. Roth's interpretation of the Sanskrit passages regarding the *Soma* not keeping.

Dr. Rice, of New York, a distinguished Sanskrit scholar said:—

"For your interesting pamphlet on the *Soma* plant I am much obliged. Of course I had read the papers by Professor Roth already in the original German, but the additional remarks now accompanying them are also interesting. I have often tried to reconcile the apparent objections against the *Soma* to be plain and simple sugarcane, but have not been able to overcome the apparently well-authenticated statements as to the altitude over the sea level and other data which positively prohibit such a belief. But the description of the plant, its pleasant juice, &c., &c., aside from other considerations, make one think of sugarcane or some species of *Sorghum*."

This is certainly a most interesting suggestion; but apart from other difficulties, it seems impossible to suppose that branches of sugarcane could have been carried from Central Asia to India so as to still contain their sweet sap. As a matter of fact, the sugarcane sap, in India, dries up completely in less than a month. Sugarcane (*Saccharum officinarum*) is very likely a native of South-Eastern Asia—from Bengal to Cochin-China. It was probably first systematically cultivated in India. It is therefore highly improbable that any form of sugarcane was cultivated in Central Asia during the Vedic period, or was, perhaps, even known to the Sanskrit-speaking people prior to their invasion of India. Most of the

Fl.*, 298 ; *Aitchison, Cat. Pb. & Sind Pl.*, 169.

Habitat.—An annual, with stems 1—1½ feet. The extremely slender pedicels, which support the long many-flowered spikelets, give rise to the constant tremulous motion exhibited by this species when in flower. It is a characteristic grass of sandy soils in North India.

Food.—The grain is said to have saved many lives during the severe famine of 1813, and which is now alluded to as the *laktāwāla sāl*.

Fodder.—Regarded as a good fodder grass at Ajmere.

Habitat.—A handsome herbaceous plant, with close spikes of white flowers and linear radial leaves, found on the Panjāb Himālaya between 6,000 and 9,000 feet.

Food.—“The leaves when young are much eaten, both fresh and dry, cooked as vegetables” (*Dr. Stewart*).Domestic Use.—*Dr. Aitchison*, in his Report on the Botany of the Afghān Delimitation Commission, draws attention to an interesting economic product derived from *Eremurus Aucherianus*, *Boiss., var. Korolkowi*. Its long fleshy roots are dried and ground into powder, which forms into a jelly with boiling water. This jelly is then hardened into variously-shaped vessels called *dabba*, used for holding oil and clarified butter. There is a large trade in this material in Khorāsān, and *Dr. Aitchison* believes that the introduction of these vessels into India would be much appreciated by the Hindū community as a substitute for the animal skins at present employed in the oil and *ghī* trade. It is not known if any of the Indian species could be similarly used.

Habitat.—A tall tree with straight trunk, prickly when young; branches horizontal and whorled. Flowers dirty white and much smaller than those of *Bombax*, with staminal tube splitting into five portions, each with two anthers, instead of into many divisions, each with one anther, as in *Bombax*. According to the *Flora of British India* this tree occurs "in the forests throughout the hotter parts of India and Ceylon: distributed to South America, the West Indies, and Tropical Africa."

Although occasionally met with in most districts of India, in only a few localities is it reported to be fairly abundant. With the view of affording information as to the localities where an effort might be made to develop a trade in kapok fibre—the floss from the seeds of this plant—the following review of the official correspondence and writings of Indian authors may be given:—

Of *Bengal Roxburgh* says: "On the Coromandel Coast, the Tamils plant the tree about their temples. In Bengal, where the winters are colder, the leaves drop off during the hot season. In February, when destitute of foliage, the blossoms appear, and soon afterwards the leaves; the seed ripens in May." The writer is not aware of having seen the tree in Bengal except as planted along road-sides and in gardens. Mr. Gamble does not mention any special locality, but remarks that it is "often planted."

Dr. King, in a list of the plants of the North-West Provinces (printed in the *Gazetteer*, Vol. IV., p. LXVIII.), simply mentions it by name. In his *Forest Flora of North-West and Central India*, Sir D. Brandis makes no mention of the tree, and Dr. Stewart is also silent as to its occurrence in the Panjáb; but Mr. Baden Powell, in his *Panjáb Products*, mentions it

briefly without stating where it is met with. It would thus appear that as far as these Provinces are concerned, while the plant occurs occasionally under cultivation, there is little or no prospect of a trade being done in the fibre from the wild or naturalised plant. Of Coromandel it may be otherwise. Roxburgh appears to have found it fairly plentiful. Sir Walter Elliot speaks of it as met with in that region, and gives it the Telugu name of *Buruga*. Turning to Burma, Kurz remarks that it is "here and there cultivated in Pegu and Tenasserim, a single tree was found on the coast forests of South Andaman." Mr Baden Powell, in his account of the Burmese Teak, mentions that it is met with over undulating hills in the Tenasserim, Dillema, and

LOCALITIES
where met
with.BURMA
294MADRAS,
295

Mr Baden Powell, says that, except in the Tenasserim District, he has not met with it in the South Circle, it is reported to be met with in the Sheveroy Range, in the Hosur taluk scattered over the lands. From other districts

trees are met with in the South Circle it is reported that the tree is found chiefly in a cultivated state, especially near temples. In Tinnevely it is found scattered about in the Ghât forests, and it is estimated that about three tons of cotton could be gathered yearly. In North Malabar the tree is found chiefly on the lower slopes of the Chenai Nair forests, but there only at scattered intervals, and it disappears further west and north where the rainfall is heavier. In Southern Malabar there is little trade in the silk cotton, such trade as there is being more often in the cotton of the *Bombax malabanicum*. Dr Shortt (*Indian Forester*, III, 296) alludes to it in a list of plants parts of which are eaten in times of famine under the following names: *Elevam*, *TAM*, *Pur*, *TEL*; and he mentions that the seeds being roasted and eaten

from the seeds, he always found it in the same way. He does not mention from what source he obtained it. In Trichinopoly the tree is referred to in a list of the "More important fruit and timber trees found in the district." It is said to be the *slatam* or *Tamil* and the remark is made: "The seeds are embedded in cushions, &c." In the Neillore of the Principal Trees of the *aga*. In the *Mysore Gazetteer* it is mentioned in the Bangalore gardens. *Imeron* gives it the Kanarese name, *E*, in a Catalogue of the drugs of this plant as being

BOMBAY.

The White Cotton Tree.

LOCALITIES
where met
with.

concerned, most abundant in the Deccan. A recent correspondence would however, appear to throw doubt on this prevalent opinion. Mr. McGregor Conservator of Forests, Southern Circle, Bombay, in a letter on the subject, wrote that *Eriodendron anfractuosum* "is said to occur in Kánara but its occurrence is doubtful." He gave it the names of *Pandha savar*, MAR., and *Bili barlu*, KAN. In the same correspondence the Conservator of the Northern Circle, Bombay, was asked for information regarding the tree, and Mr. A. T. Shuttleworth replied that "*Eriodendron anfractuosum*, though stated in some botanical publications to be a common tree in the forests of the northern circle, is exceedingly rare, and Khandesh, where it is supposed to grow in large numbers, there is scarcely a tree of the kind to be seen in the forests. Authors of works on the Forest Flora of Western India have evidently mistaken some other tree probably *Bombax malabaricum*—for the Kapok or white cotton tree."

It would thus appear that there is room for doubt as to the existence in Bombay of *Eriodendron* as an abundant tree, and much confusion appears still to prevail in the identification of the kapok tree; popular writers are apparently unable to recognise it from *Bombax*. The vernacular names now given to the kapok tree might easily enough be adaptations from the names given to *Bombax*. The Sanskrit word *sálmali* is by some writers given to the one, by others to the other. *Sálmali*-wood is prescribed in the Institutes of Manu as that on which washermen should wash clothes. No writer definitely affirms that *Eriodendron* is wild nearly all speak of it as cultivated, and it may be the case that India can only hope to take part in the growing kapok trade after some years when the tree has been still further cultivated, in some of the regions where it now successfully grown. It would, however, be undesirable to accept the final present information; and as in a measure opposed to the opinion expressed by Mr. McGregor and Mr. Shuttleworth it may be as well complete this brief review by quoting some of the passages in which it affirmed that *Eriodendron* is a fairly common tree in both the southern and northern divisions of Bombay. Lisboa (*Useful Plants of Bomba p.* 195) says: It is "a very common prickly tree with palmate leaves and dingy white flowers." There can be no mistake as to the plant they meant; it is *Eriodendron* and not *Bombax*. Dalzell and Gibson also describe the tree in language which cannot be mistaken, and they add: "grows in Khandesh;" its native name being "*Shameula*." Dr. Grainger in his essay on the "Botany of the Bombay Presidency" (*Gazetteer XXV.*, 322), says that "*Eriodendron* is another large tree" (he has just been speaking of *Bombax*) "similarly distributed in this country." "It is known as the white silk-cotton tree." Of *Bombax* he says it "is common in all the forests of the Presidency from Gujarat and Khandesh to Kánara." Turning now to the *Bombay Gazetteers* Mr. Talbot, in the Kánara volume, says that *Eriodendron anfractuosum* is the *Bile barlu* of the Konkan, and *pándhari sávar* of MAR.; he remarks that "the white cotton, though fairly large, does not grow to the same size as *Bombax malabaricum*. The pods are gathered for their cotton." Of the *Pancl Mahál's* it is stated that "the *Shamla*, *Eriodendron anfractuosum*," is similar in appearance to *Bombax malabaricum*, the *Shimal* or *Shimar* "but differs in the flower," those of *Bombax* "a dull crimson and those of *Eriodendron* a dirty white." The writer of the chapter on the *Pancl Mahál* forests thus made no mistake, and Mr. Talbot's reputation as a botanist warrants the most complete confidence being placed on his statement that the tree occurs in Kánara. Of the Poona District it is stated "*Hattian*, *Eriodendron anfractuosum*, though not plentiful, is found in the thicker forests on the western hills. The light and soft wood is

Kapok Floss

(G Watt)

ERIODENDRON
anfractuosum.

soft wood of no use, save for making toys or fancy articles. The down round its seeds is used for stuffing pillows. It is not common anywhere in Khandesh.

Gum — This gum is of a dark-red colour and almost opaque. It is generally known as *kattian-ke-gond*, and by European writers is said to be one

is, however, said to be astringent and to be employed medicinally in

It is interesting to note that the name *kapok* (or *capock*) was known a hundred years ago, and that it is a Malayan and not a Dutch name as some writers have stated. Only the other day a great advance was supposed to have been made by the discovery of the plant from which the Dutch fibre *kapok* was obtained. This fibre was well known to Ainslie nearly a century ago, and it is worthy of remark that the word *kapok* bears a close resemblance to the *karpasi* of the Sanskrit writers, and that the most general modern names for the plant *Hattian* and *Kattian* seem to be directly derived from the Arabic *Kattar*, both these classical names are, however, now stated to be synonyms for cotton. (Conf with the

The White Cotton Tree.

FIBRE.

seeds is, however, according to the present demand, a fibre of great merit. The modern trade in it was created by the Dutch merchants, their supply being drawn from Java. It is used in upholstery, being too short a staple to be spun, and, indeed too brittle and elastic. But these are the very properties that commend the floss to the upholsterer. In cushions, mattresses, &c., its elasticity and harshness prevent its becoming matted as is the case with *simal* floss, and it is, therefore, considerably superior to that fibre. Indeed, it is probable that the even still shorter staple of *Cochlospermum* would in time command a better price than that of the *simal*. Like *Kapok* it is very elastic, the fibre springing up to its former position the moment the weight is removed from the cushion. With *simal*, on the other hand, a very short time suffices to make a mattress assume permanently a compressed condition, in which it occupies perhaps less than half its original bulk and at the same time becomes knotted. This necessitates the removal of the stuffing to be teased or rudely carded.

It will thus be seen that if future extended usage of *Kapok* confirms the properties attributed to it, the demand for the fibre will year by year increase. But while endeavouring to participate in this trade it becomes essentially necessary that an error made by many writers be guarded against, namely, that of viewing *Kapok* as a generic trade-name for all the silk-cottons—including that of the *simal*—the floss of *Bombax malabaricum*. When the demand for *Kapok* first started, Indian exporters placed in the market a quantity of very dirty *simal*, having a large percentage of dust as well as seed. This was at once condemned, and fetched a price that would not even cover the transport charges. India thus fell into an inferior position which it is possible might never have been the case had carefully-cleaned *simal* been sent to Europe. A low-priced fibre like that of either *Simal* or *Kapok* cannot bear the extra freight of a large percentage of dust. It becomes essentially necessary that the floss be cleaned, freed of seed, and carefully baled. At the Colonial and Indian Exhibition, a large assortment of *simal* floss was shown, and the writer had the opportunity of conversing with several Dutch and English dealers in *Kapok*. These gentlemen assorted the *simal* samples and pointed to the fact that even among these there were inferior and superior qualities. Some had twice as long a staple as others, while the *Kapok* property of elasticity was possessed by but few. After this had been done Mr. Cherry's true *Kapok* floss was shown, when in every case the experts recognised it as *Kapok* and were eager to know the price, amount available annually, and the names of merchants with whom they might open up dealings. Unfortunately these were points regarding which no information could be furnished.

The necessity for care in future efforts may be apparent when it is here stated that nearly every trade journal which has published notices regarding *Kapok* has viewed it as one and the same thing with *simal*. Thus the *Indian Agriculturist* (October 16th, 1886) says that every person in India is familiar with "the value of the 'tree-cotton,' as stuffing for pillows and bedding, and *Kapok*, which is really the Malayan name for it, is the designation by which it is known in the Dutch and Australian markets, &c., &c." The writer of that article was apparently very liberally compiling from a paper which appeared in *Buchanan's Monthly Register* (Melbourne, June 21st, 1886), in which the tree-cotton—*Bombax malabaricum*—is incidentally mentioned along with *Cochlospermum Gossypium* and the *Baobab* tree of Africa as "in their growth and products" possessing "very little difference." Indeed, it seems probable that, as far as the Australian trade in *Kapok* from India is concerned, the floss of *Bombax*

The Kapok Floss.

(G. Watt.)

ERIODENDRON
anfractuosum.

malabaricum is that which is so designated. While that may be so, the necessity for distinguishing the two fibres none the less remains in its full force, and the above reference to the *Indian Agriculturist* has been made

continuance of
by the Govern-
sking the name
"also whether

the exports of the tree cotton obtained from the *Bombax* or *Enodendron* trees are the larger." The reply may be here published, as it is highly instructive :—

"BRITISH CONSULATE, "BATAVIA;
"10th November 1887.

"I have the honour to acknowledge receipt of your letter No 214—24-1 P. & S. of the 29th September last, and, in reply thereto, I beg to inform you that the scientific name of the tree from which Kapok is chiefly obtained in Java is *Enodendron anfractuosum*. The exports of Kapok from the Netherlands India have been as follows :—

	Kilos.		Kilos.
1882	302,201	1884	426,061

however, is round, about the thickness of a pin, and two or three times longer than the fruit." These unripe fruits are regarded as demulcent and astringent. The exact original use of the expression *Mariti-Moggu* is not quite clear—*Moggu* means buds. The roots are also used medicinally, being one of the forms of *Māli* or *Mūli-gandul* (described under *Bombax malabaricum*, Vol. I., No. B. 653). Dr. Dymock explains that in the Concan the young roots of *Eriodendron* are preferred to those of *Bombax*. "They are dried in the shade, powdered and mixed with the juice of the fresh bark and sugar. This tree is called *Pāthra-Saur* in Marathi and *D. l. Sauris* in Gujarathi" (*Mat. Med. West. India*, 2nd Ed., 106). The leaves and also the seeds have medicinal virtues attributed to them, but they do not seem of sufficient merit to deserve separate description.

SEEDS. *Orissas*.—"A handful of the tender leaves of this plant is ground into a paste and is administered to a patient newly attacked with gonorrhoea. One dose at 6 A.M. is given daily for three or four days, and a little butter-milk is taken with it" (*Surgeon W. F. Thomas, Madras Army, Mangalore*). "The gum is also used in the incontinence of urine of children" (*Surgeon-Major F. J. L. Rutton, M.D., M.C., Salem*). "The root of the young plant is used in the form of decoction in cases of chronic dysentery and diarrhoea, also in cases of ascites and anasarca when it acts as a diuretic." (*Civil Surgeon F. H. Thornton, B.A., M.B., Monghyr*).

Food.—The seeds are said to be eaten, and the young or unripe fruits are also stated to be used in cookery. The seed-cake is sometimes given as Food. Dr. Warden has kindly furnished the following note on this subject showing the comparative composition of Kapok to Cotton-seeds:—

"The seeds of the Kapok tree have been made into cakes, and the comparative value of the seed-cakes and ordinary cotton-seed cake for cattle-feeding purposes has formed the subject of an enquiry by Mr. G. Reinders. The following analytical results were obtained:—

	Kapok cake.	Cotton cake.		Kapok cake.	Cotton cake.
Water	13.28	12.0	Non-nitrogenous ex- traction	19.92	35.42
Nitrogenous matter; albuminoids com- pounds	25.31	20.62	Woody fibre	28.12	20.36
Fat	5.82	6.56	Ash	6.52	5.64

"The ash of the Kapok-tree seed contains 28.5 % of phosphoric acid and 24.0 % of potash; it ought, therefore, to be of value as a manure."

Structure of the Wood.—Soft, very light; 30lb per cubic foot. According to some writers this is the *Salmali* of Sanskrit writers. It is used for toys and other such purposes, and is sometimes hollowed out into canoes. (*J. F. Duthie*.)

323

Eriophorum comosum, Wall.; CYPERACEÆ.

Syn.—ERIOPHORUM CANNABINUM, Royle; SCRIPUS COMOSUS, Roxb.

Vern.—Bábar, bab, babila, bhabhur, bhabhuri, N.-W. P.; Pan-babiyo (Almora), KUMAON.

References.—Atkinson, *Him. Dist.*, 808; Royle, *Ill. Him. Bot.*, 415; Royle, *Fib. Pl.*, 34; Huddleston, *Trans. Agri. Hort. Soc. Ind.*, VII., 272; Balfour, *Cyclop.*, I., 1053; *Ind. For.*, IV., 168; IX., 569; Linn. *Soc. Jour.*, XX., 409.

Habitat.—A coarse sedge-like perennial herb, the heads of flowers clothed with long silky hairs. Common in the Siwaliks and outer Himálayan ranges. Allied to the Cotton grasses of Europe.

FIBRE.
324

Fibre.—The fibre yielded by this plant forms a very small portion of what is exported to the plains under the name of bhábar. This latter is the produce of a grass named *Ischoemum angustifolium*. The Eriophorum fibre is utilised locally, but it is often difficult to discover whether it is pure or mixed with *Ischoemum*. Former writers are in error who have attributed Bhábar entirely to Eriophorum.

Captain Huddleston, in *Trans. Agri.-Hort. Soc. Ind.*, I., c., mentions that "All the jhoolas or rope bridges, which are erected over the large rivers, where sanghas or wooden planked bridges cannot be made, on all the principal thoroughfares of this district, are constructed of this silky species of grass, the cables of which are of a considerable thickness. This grass grows abundantly in all the ravines up the sides of the mountains, and is to be had only for the cutting, but it is not of a very durable nature, though pretty strong when fresh made into ropes. It lasts about a twelvemonth only, or a little more, and the people in charge of the rope bridges are constantly employed in repairing and annually renewing the ropes and stays. The 'chinkas' or temporary bridges of a single cable, upon which traverses a seat in the shape of an ox-yoke, are also sometimes made of this grass." For further information regarding bábar grass, see *Ischoemum angustifolium*.

E 358

The Coca Plant. (J. Murray.)

ERYTHROXYLON
Coca.

Madras, March 1885, Rusby "The Cultivation of Coca," *Therapeutic Gazette*, January 1886.

Habitat.—A shrub, 2 to 6 feet high, much branched, somewhat resembling the black thorn.

It is found in Peru, Bolivia, Brazil, the Argentine Republic, and other parts of South America, growing from 2,000 to 8,000 feet above the sea-level, but according to De Candolle the plant is indigenous only to the two former countries. It is an escape from cultivation as generally met

India
nuary,

An intermediate form is provisionally adopted as exhibiting the general character

variety

Ceylon

India

intermediate form, the Bolivian Coca.

History.—The name *Coca*, sometimes called *Cuca*, is a corruption of the Aymara Indian word *K'oka*, signifying "plant," the plant *par excellence*

The natives of Peru have utilized this bush from the earliest period, and its employment was general at the time of the conquest of that country by Spain. From Peru (and, according to De Candolle from Bolivia also,) it seems to have spread over the other parts of South America, where the cultivated plant is now to be found in all localities, the natural conditions of

HISTORY,
359

INTRODUC-
TION.

the wonderful sustaining effects of which were beginning to be recognised in Europe, would rapidly become an important article of commerce. No steps of any importance, however, seem to have been taken till 1835, when, owing to the discovery of the value of Cocaine as an anæsthetic, the demand in Europe for the Coca leaf was rapidly increased. As a

all nothing to be added.

Owing most probably to the great increase in exportation of the plant

E. 360

ERYTHROXYLON

Coca.

The Coca Plant.

HISTORY.

from South America, and its consequent cheapening in the European markets, Coca cultivation in India has not materially developed since its introduction. Indeed, of the tea districts of Ceylon, Madras, Mysore, and Bengal, it may practically be said that it is now, as it was three years ago, grown only experimentally.

CULTIVATION.

CULTIVATION
301

Method followed at the source of supply.—The *Tropical Agriculturist* of November 1885 publishes an account taken from *The Ephemeris*, of which the following may be given as the substance :—

Coca is grown on terraces on the sides of deep narrow valleys, between the heights of 3,000 and 6,000 feet. In August the seeds are sown in boxes or beds, and in June they are transplanted to the hill terraces and deposited about three feet apart. The soil must be rich in vegetable manure, and free from weeds; the crop, in other words, is an exhausting one, necessitating virgin soil. In consequence a forest clearing is generally chosen, the ground being already rich in decayed vegetable matter.

Dr. Warden, in his note on "*Erythroxylon Coca grown in India*" writes :—

"From a high altitude, the best results as to total alkaloids have been yielded by plants grown on a hill-side soil rich in vegetable manure. But a rivalry exists between this variety of soil and a yellow clay. The author is inclined to think that those who prefer the latter soil do so because it yields a somewhat larger crop.

"The ground for the nursery beds is prepared during the latter part of the dry season, by breaking it up very thoroughly to the depth of a foot or more. The plan of sowing the seeds broadcast as soon as gathered, and covering with a little earth, or better, a layer of banana leaves or decaying vegetable matter, has been found to answer. Germination requires from eight to twelve days longer than by adopting the native method, which consists in depositing the seeds, as soon as gathered, in a shaded place in layers an inch or more deep, and covered with a thin layer of decaying leaves. The heat generated by the decomposition of the fleshy pericarps seems to induce germination, and the embryo bursts its bony covering. This growth unites them in from eight to fourteen days into a solid mass which is broken up into small pieces and planted in furrows in the nursery. In this process very many of the sprouts are broken off and the plants destroyed. A covering of brush or straw must be placed over the nursery, at first only three or four inches above the surface, and elevated as the plants grow.

"On the manner in which the ground is prepared for the plantation much of the future well-being of the plant depends. The ground should be thoroughly powdered to the depth of two, or, if possible, three feet, and all roots and large stones removed. It is generally believed that shade tends to the production of the best quality of leaves, and the cocales are therefore planted thickly with a small broad-topped leguminous tree related to the St. John's head plant. The custom appears to have arisen from two considerations. There is a period, already referred to, of two or three months during which no rain falls; and then these trees afford protection from the sun. Secondly, because shade conduces to the production of a large smooth leaf of elegant colour and thus adds to the appearance of the product. From repeated comparative assays made by Rusby of shade and sun-grown leaves from adjoining plants, the sun-grown leaves were invariably much richer in total alkaloids.

"The plants are transplanted from the nursery at the advent of the permanent rains, and are set out from half an inch to three feet apart. They grow to a height of two to six feet, but the largest plants do not yield the

The Coca Plant. (J. Murray.)

ERYTHROXYLON
Coca.

best leaves. Great care must be taken to keep the soil thoroughly stirred and free from weeds. (*Four. Agri.-Hort. Soc., Vol. VIII., Pt. II., New Series, p. 149*)

CULTIVA-
TION.

Most American writers appear to hold that the plant is better cul-

to manure.

In India

In India.—The following interesting facts regarding the effects of

Just prior to this the soil is stated to have been highly manured, but no particulars as to the precise nature of the fertiliser are afforded. The leaf grown at Arcuttipore yielded very considerably more alkaloid than any of the other samples examined, while that grown in the Jaunpore district contained only 571 per cent. of alkaloid. I have no information whether the Arcuttipore plants were grown in the shade or open. On the Jaunpore Tea Estate there appear to be four plants, two in full sun-shine and measuring 5½ feet and 5 feet 2 inches in height respectively, one in partial shade 3 feet high, and one in shade 5 feet high, and I gather from the Manager's letter that the leaf sent me was collected from the plant which grew in the shade.

"Taking into consideration the amount of potash contained in the leaves and the rapid exhaustion of the soil which would necessarily ensue from repeated plucking of the leaves, it appears to me that though at first a nitrogenous fertiliser would be beneficial, yet after a time the addition of a fertiliser containing potash in some form in addition to nitrogenous matter would be necessary. The amount of nitrogen in the soot or cow-dung might possibly suffice, but whether the amount of potash in the cow-dung would be sufficient to supply the place of that removed from the soil by the leaves is an open question" (*l. c. p. 153*).

From reports furnished at various times in the amount of

the cultivation at lower altitudes in India, as far as

abo

a co

spec. addition to weeding.

SERIAL REPORTS.—The Conservator of Forests, Southern Circle, Madras, writes:—"This Circle has not got beyond the experimental stage. No regular areas have been planted. In Wynnad the planters have a few plants here and there, but apparently more as curiosities than anything else, and the Forest Department there has about one hundred plants. The District Forest Officer has observed that it seeds less freely in Wynnad than on the coast." The Deputy Conservator of Forests, Coorg, reports:—"Coca has only been cultivated in gardens in Coorg. Flowers and fruits in Mercara. It seems doubtful if its cultivation would pay."

COLLECTION AND MANUFACTURE.

In Peru and Bolivia two crops are gathered, the first, the "March

T

E. 362

MANUFAC-
TURE.
362

ERYTHROXYLON Coca.

The Coca Plant.

COLLECTION
AND MANU-
FACTURE.

crop," commences in January, the second, the "St. John's" crop, begins in May. The first picking of leaves is made one year and a half from the date of transplanting. During the first five years the percentage of the alkaloid, cocaine, yielded by the leaves increases rapidly, reaching its maximum about the tenth year. The plant retains its full productive power till about the twentieth, after which it slowly declines till about the fortieth year, probably owing to exhaustion of the soil.

The women and children collect the mature leaves, which are known by being bright green on the lower, and yellowish on the upper, surface. Each leaf is picked separately, and very carefully, and every precaution is taken not to touch the top of the bush. The leaves are then conveyed to the place of preparation, where they are laid out in a single layer on a pavement, kept scrupulously flat and clean, which has been previously heated by the sun. The necessity of the pavement being already hot is greatly insisted on. The leaves are stirred occasionally until dry, which they become in about three hours. They are then either placed for a short time in storage houses, where they undergo a slight sweating process, or are at once packed. The slightest amount of moisture is fatal to the leaf after being dried. The leaf should therefore always be packed in zinc, or tinned, air-tight boxes.

In India several methods of drying artificially, in tea driers or charcoal *chulns*, have been experimentally tried. According to Dr. Warden the results by all are equally good.

He writes:—"The object which should, I think, be kept prominently in view, is to dry the leaves as thoroughly and quickly as possible at the lowest temperature. The plan adopted at Arcuttipore of first withering the leaves in the shade, and then drying them in a tea drier at 150° Fh. for 10 minutes, appears to me as good as any. I do not think any advantage is to be gained by employing a higher temperature. In whatever way dried, the leaves should be at once packed in air-tight boxes directly they are cold."

MEDICINE.
Leaf.
363

Medicine.—From the earliest dates the Indians of Bolivia, Peru, and Brazil have ascribed marvellous properties to the LEAF of the Coca plant. Chewed, either alone or mixed with lime, or taken in various forms of syrup and decoction, the consumer is enabled to sustain the greatest fatigue and hardship, without either food or sleep, for a lengthened period. The drug is also said, especially when taken as an infusion or decoction, to prevent difficulty of respiration in ascending hills. Consumed in any form it produces a peculiar excitement, slow and sustained, and diffused generally over the nervous system, accompanied by a general feeling of well-being. When eaten along with tobacco it is reported to produce a condition of intoxication very similar to that caused by alcohol or Indian hemp. Prolonged or excessive use of the drug is followed by much the same results as over-indulgence in opium. The Coca-eater loses his appetite, suffers from impaired digestion, and, when not under its influence, becomes phlegmatic and apathetic. According to Johnston in his *Chemistry of Common Life* quoting Von Tschudi, "The inveterate Coquard (or Coca-eater) is known at the first glance. His unsteady gait, his yellow skin, his dim and sunken eyes, encircled by a purple ring, his quivering lips, and his general apathy, all bear evidence of the baneful effects of the Coca juice when taken in excess." Von Tschudi, however, states as the result of his inquiries, that "the moderate use of Coca is not merely innocuous, but that it may even be very conducive to health."

Dependent on these properties, the infusion of Coca is viewed as a valuable remedy in asthma and colic, and that the leaves applied externally as a plaster to cure boils and ulcers.

E. 363

The Coca Plant.

(J. Murray.)

ERYTHROXYLON
Coca.

MEDICINE.

The Indians of Peru, probably influenced by their experience of the wonderful properties of the leaf, are said to regard it as sacred. Its use is much intermingled with their religious rites, and to the plant itself worship is rendered.

Since the introduction of the leaf into Europe, many writers have

the action of the alkaloid. It is now most extensively employed as a local anæsthetic in many minor operations, and is specially valuable in ophthalmic surgery, since it produces complete insensibility to pain in the superficial structures of the eye. It is also mydriatic, and paralyses the accommodation. Cocaine seems to act by paralysing the termination of the sensory nerves in any structure to which it is applied, but this paralysis remains purely local and does not last long. Indeed, this limitation of its action to the tissues to which it is directly applied, is the most valuable

and a peculiar way

From recent researches, however, it would appear that the amorphous cocaine, formerly described, is in reality a solution of cocaine in the volatile oily body *hygrine* (Stockman, *Journal Pharm. Society*, April 23rd, 1887). Regarding *ergonin*, it appears that it also does not exist ready formed in the leaves, but is a product of the decomposition of Cocaine (Dr. Warden's note on *Erythroxylon Coca* grown in India—March 1888). The further elucidation of this question is to be hoped for, as the cocaine of commerce at present seems to vary much in character, and a more exact knowledge of its true chemical nature is required to determine whether the amorphous substance often connected with the alkaloid and its salts, may not be the cause of the objectionable effects which sometimes follow its use. Excluding these doubtful substances, therefore, there remain to be considered the alkaloid cocaine, *hygrine*, *coca-tannin*, and the wax.

Cocaine
365

ERYTHROXYLON Coca.

The Coca Plant.

CHEMISTRY.

It has a bitterish taste, and crystallizes in small shining monoclinic prisms. The pure alkaloid is much used in medicine, especially in the manufacture of oleates and ointments, for which it is more suitable than its salts, owing to its solubility in fats and oils. The amount of the alkaloid obtainable from the leaf of commerce is variously stated as from '2 to '5 per cent.

Hygrine.
366

2. **HYGRINE**—is described by Wholer and Lossen as "a pale yellow, volatile, oily body, giving the ordinary reactions of alkaloids, hygroscopic, and forming hygroscopic salts which crystallize with great difficulty."

Coca-tannin.
367

3. **COCA-TANNIN**—resembles the tannin of tea in giving a deep brownish green colour with the persalts of iron. It has been found to vary much in quantity in the different leaves examined in this country. Dr. Warden writes:—"It is of interest to note that the largest deposits of *coca-tannin* occurred in those samples which yielded the highest percentage of alkaloid. It appears to me, therefore, as not improbable that in the leaves the *cocaine* is in combination with the acid to which this term of *coca-tannin* has been applied."

Wax.
368

4. The **WAX** is unimportant.

Dr. Warden, in his paper above quoted, gives a number of very interesting analyses of leaves grown in different parts of India, from which it would appear, that the percentage of *cocaine* is higher than that recorded in any previously published assay. Those which yielded the best results were leaves from Ranchi, Arcuttipore, and from the Central Terai Tea Co. They contained an average percentage, on the anhydrous leaf, of over 1, the highest being 1'671. Though, as above noted, the physical character of the alkaloid obtained by Dr. Warden differs from that of the American leaf, it has been proved that it is equally efficacious as a local anæsthetic. Dr. Saunders, Professor of Ophthalmic Surgery at the Medical College, Calcutta, used a 4% solution in thirteen cases of operation for cataract and many minor operations, and found that it differed in no way from other *cocaine*, except that it appeared to have a quicker and slightly stronger action. Should Warden's analysis be confirmed that the cocaine of the Indian plant neither spontaneously crystallizes itself nor possesses spontaneously crystallizable salts, it might be objected to on purely pharmaceutical grounds; but it is to be remembered that the salts of the alkaloid are mainly used in solution.

TRADE.
369

Trade.—It has been clearly established that the climate and physical conditions of many parts of India are in every way suitable for the growth of **Coca**; but whether it will pay to cultivate the plant is another question.

According to Squibb in the *Ephemeris*, May 1887, the Peruvian Government records and taxes a production of 15,000,000lb per annum, and the Bolivian Government 7,500,000lb. Of the latter quantity 5% or 375,000lb is exported to the United States and Europe. Assuming that from the doubly great produce of Peru, twice the quantity above mentioned reaches the United States and Europe, an aggregate export of 1,125,000lb annually is arrived at. This amount of leaf, if manufactured, would yield from 2,000 to 3,000lb of cocaine. When it is remembered that the uses of **Coca** are very limited in Europe, that it is employed almost entirely as a medicine, and that there are no indications of **Coca** preparations coming into general use as a beverage, it seems very improbable that cultivation of the plant to any great extent would pay. Still, the Indian plant seems to be peculiarly rich in the alkaloid, and small quantities carefully prepared and packed would probably find a ready sale in Europe.

wood being sold in Madras and used in slight cases of dyspepsia and continued fever, and also in some cases of dropsy. He says the wood has a strong aromatic and agreeable smell. Dr. Bidie mentions the powder as used medicinally as a substitute for sandal wood. The BARK is said by Dr. Shortt to be employed as a tonic in fever, being prepared as an infusion. The leaves when eaten as a vegetable are believed to possess refrigerant properties, and the pulp beaten into a LINIMENT with gingelly oil is used, as an external application to the head. (*Madras Agri. Hort. Soc. Journal*, IV., 41). This statement, regarding the preparation of a liniment, was apparently first made by Ainslie (*Mat. Med.* II., 421) regarding the plant he calls *E. areolatum*, Willd.

Food.—Both in the various Madras accounts of this plant and in Mr. Lisboa's *Useful Plants of Bombay*, the LEAVES are said to be regularly eaten as a green vegetable. Of Madras it is reported that they are used in curries, and that in famine times they are boiled with rice, *ragi*, &c., to increase the volume of food. Mr. Lodge (*District Forest Officer, Cuddapah*) writes that, the plant yields a "small red juicy FRUIT with a refreshing taste, and a flavour somewhat resembling that of a cherry."

Fodder.—The Government of Madras recently called for information as to the extent the LEAVES of this plant were used as fodder. The replies showed that they were "sometimes but rarely used in the Godavari, Cuddapah, and Anantapur districts." The Collector of Salem, however, reported that "no one recognises it as a fodder-plant, and that cattle have been seen to pass close to young succulent coppice shoots without touching them." The Madras report concludes, however, by saying that elsewhere, when other supplies fail, cattle, sheep, and goats eat the plant.

Structure of the Wood.—Sapwood white; heartwood dark-brown, with a pleasant resinous smell; it is very hard, takes a beautiful polish, and is sometimes used as a substitute for sandalwood (*Santalum album*).

Esparto Grass. See *Lygeum Spartum* and *Stipa tenacissima*.

(*J. F. Duthie*.)

EUCALYPTUS, *L'Her.*; *Gen. Pl.*, I., 707.

The majority of the species, of which about 140 have been described, are confined to Australia and Tasmania, where they afford characteristic features in the scenery of those countries. A few occur in New Zealand, and in some of the islands of the Indian Archipelago.

Popularly known under the general name of 'gum trees,' they are locally distinguished in Australia by characters observable in the bark; which, in some of the species, is fibrous or stringy, in others hard and fissured, whilst sometimes it presents a smooth and polished surface, and occasionally it scales off in flakes. The botanical determination of the species is often difficult, owing to the close similarity of their floral structure, as well as to the various forms sometimes assumed by the foliage on different portions of the same tree, and at different periods of its life. This task has, however, been greatly lessened by the researches of the eminent local botanist, Baron von Mueller, brought to light in his very valuable illustrated monograph entitled "*Eucalyptographia*."

As trees they are chiefly remarkable for their rapid growth, and the enormous height to which some of the kinds attain; one specimen in Victoria, a fallen one, having been found to measure 480 feet in length; and specimens of *E. obliqua* (the String-bark) have been felled in Tasmania, the trunks of which measured 300 feet high and 100 feet in circumference.

The timber yielded by some kinds, notably that of *E. Globulus* (Blue gum), *E. marginata* (Jarrah or Mahogany of South-West Australia), and

E. 381

Eucalyptus—Gum Trees. (J F Duthie) EUCALYPTUS.

E. robusta (Red gum of South Australia), = extremely valuable on account of its strength and durability under water, and its immunity from attacks by white-ants.

An astringent substance resembling kino (a product of *Pterocarpus Marsupium*) is yielded by several of the species, and is used medicinally, as well as for tanning and dyeing.

A still more important product is Eucalyptus oil, which, through the exertions of Mr. J Bosisto of Melbourne, has recently been extensively brought into commerce, and is now being employed for various purposes.

HISTORY.

as quanti-
me influ-
prevails,
thorough
ees. The
Plants,"

<i>E. amygdalina</i>	3 313	per cent. of volatile oil.
<i>E. oleosa</i>	1'250	" "
<i>E. Leucoxylon</i>	1'060	per cent. of volatile oil.
<i>E. gomocalyx</i>	0'914	" "
<i>E. Globulus</i>	0'719	" "
<i>E. obliqua</i>	0 500	" "

Baron von Mueller then goes on to explain that the lesser quantity of oil of *E. Globulus* is compensated for by the vigour of its growth and the early copiousness of its foliage, and that the proportion of oil varies somewhat according to locality and season. "*E. rostrata*," he says, "though one of the poorest in oil, is nevertheless important for malaria-regions, as it will grow well on periodically-inundated places and even in stagnant waters not saline."

Though confined to the Australian continent and its neighbourhood, the various species of Eucalyptus are found to thrive under very different influences as regards climate and soil. Some occur at elevations where snow

various kinds of Eucalyptus, and it was then that *E. resinifera*, Smith, and *E. rostrata*, Smith, were first introduced for cultivation in the plains. These two species, however, were not well adapted to the climate and soil of Northern India, and there are now several other species of Eucalyptus which are well adapted to the climate and soil of Northern India, and are now being introduced for cultivation in that region.

J. F. Duthie

EUCALYPTUS
Globulus.

The Blue Gum Tree.

HISTORY.

Ránikhet and Abbottabad. *E. citriodora*, Hook., and *E. melliódora*, A. Gunn, both having deliciously-scented foliage, are thriving well in many places in the plains of North India.

The following communication was received from the Conservator of Forests, Panjáb, in August 1889 :—"A considerable number of different species of *Eucalyptus* have been tried in various parts of the Province, but on the whole the results have not been satisfactory; it has been found, however, that planting in groves gives a better chance of success than when the trees are grown singly along roads, &c. In Kangra, in the Kothala estate, and in Kulu, a few specimens of the "blue gum" and other unknown kinds, have done well, and experiments are now being made in the Dera Tahsil.

"The species has been introduced into Bashahr, but has not yet established itself; but in Hazara, the experiments have been successful, and there are now a number of trees round Abbottabad 80 feet high. In Chamba attempts were made at Kalatop, Chamba, and Bakloh; at the two former places they failed, but there are about 100 trees flourishing at Bakloh. The most extensive experiments that have been made were in the Lahore District at Changa Manga and in the carob plantation at Lahore. In all twenty-five species have been tried; but out of these only three, *E. rostrata*, *E. citrioides*, and *E. resinifera*, have had any real success.

"The cause of this failure may be mainly attributed to three sources: 1st, failure in the rains; 2nd, injury to the young stems by sunburn; 3rd, the worst of all, the white ants which attacked the tree by eating away the supporting roots. From these causes, but mainly from the last, only some 300 *Eucalypti* have succeeded in Changa Manga out of the several lakhs that have been planted out.

Habitat.—A lofty tree, gregarious in Victoria and the south of Tasmania. Its introduction into India has met with complete success on the Nilghiris, where the plantations, which were started in 1863, are well established. It has also been successfully cultivated at Abbottabad and Ránikhet. It does not thrive in the plains, nor on the outer Himálayan ranges.

Cultivation.—The seeds of the 'Blue gum' are unusually large for the genus; they germinate freely, and the seedlings at once begin to shoot up with marvellous rapidity. Great care, however, is required in transplanting them.

Gum.—The BARK of this tree exudes an astringent gum resembling, both in appearance and properties, that which, under the name of *kino*, is yielded by *Pterocarpus Marsupium*. It is known in trade as 'Australian,' 'Botany Bay,' or 'Eucalyptus kino.' A kino of better quality is obtainable from other species of *Eucalyptus*, such as *E. rostrata*, *E. corymbosa*, and *E. citriodora*, and, according to the authors of the *Pharmacographia*, might with no disadvantage be substituted for that of true kino.

EUGENIA.

The Blue Gum Tree; Teosinte Grass.

FOOD.
390
TIMBER.
391

INDUSTRY.
392

Food.—A liquor is made from Eucalyptus that has attained some reputation in Australia.

Structure of the Wood.—Strong, tough, and durable, and extensively used in Australia for ship-building, house-building, sleepers, telegraph poles, &c. It has been found by experiments to rival in strength the best English oak.

INDUSTRIAL USE.

In a recently published report on the Lucknow Horticultural Gardens, it is mentioned that a new demand for the leaves of the tree has arisen, owing to the discovery having been made that a decoction has the power of removing the scale or incrustation which forms in locomotive boilers, as a deposit from the water.

The matter is now engaging the attention of the Locomotive Department of the Bengal and North-Western Railway at Gorakhpur, and it is reported that the trials there made have had good results.

The following extract from a letter regarding the method of use is published: "We have a large tank, which we fill with leaves and small branches, the water is then put in, and boiled or made warm with waste steam. This continues till the fluid has a dark colour, when it is used; say, two or three gallons of the decoction is put into the tender, and so mixes with the water or enters the boiler with the feed.

"I learn excellent results are being obtained, as the scale tumbles off the plates when the boilers are being washed out."

EUCHLÆNA, Schrad.; Gen. Pl., III., 1114.

393

Euchlæna luxurians, Ascherson; Duthie, Fodder Grasses, N. Ind.,

TEOSINTE, Fr.

[19; GRAMINEÆ.

Syn.—REANA LUXURIANS.

References.—Christy, *Comm. Pl.*, III., 5; Smith, *Dic.*, 409; Kew Reports, 1879, 17; 1880, 80; Journ. Agri.-Hort. Soc., 1885, Vol. VII., pt. 3, New Series; Proccs., Soc., CVII.; Ind. For., X., III., 111; Journ. Agri.-Hort. Soc., VI., 117; Mueller, *Select Extra-Trop. Pl.*, 165.

Habitat.—A native of Guatemala. It is a quick-growing succulent grass resembling maize. It requires 9 or 10 months from sowing to the ripening of its seed, and within that period single cultivated specimens have been known, under generous treatment, to produce as many as 90 stems, and to attain 18 feet in height. It is a prolific seed-bearer. Dr. Schweinfurth is reported to have secured from three seeds about 12,000 grains.

FODDER.
394

Fodder.—The grass is described as a most excellent fodder for cattle. The attempts hitherto made to introduce it into India have not had any definite results, for while in some places it has been favourably reported on, in others it has failed, and the general opinion is that it could never compete with the existing fodder plants of India, such as *juar*, &c., as its cultivation on a large scale would be too expensive owing to its requiring rich soil and constant irrigation.

395

EUGENIA, Linn.; Gen. Pl., I., 718.

A large genus, containing over 700 species, of which about one fifth are represented in British India. They consist of trees or shrubs with evergreen, smooth foliage; and many of them are very handsome when in flower. They are found most abundantly in the humid regions of North, East, and South India, also in Burma, Malaya, and Ceylon. A few only of the Indian species are of economic importance. The three sections, *Jambosa*, *Syzygium*, and *Eugenia*, have by many writers been treated as separate genera. In *Syzygium* the petals are combined, and usually fall off in one piece; many of the species are fine large timber trees. In *Jambosa* and *Eugenia* the petals are free and spread-

MEDICINE.

Surgeon, Rajshahye.) "160 grains of the pulverized seed is taken as an antidote in cases of *Nux vomica* poisoning." (*Surgeon W. F. Thomas, Madras Army, Mangalore.*) "Used in diabetes and in enlargement of spleen. Dose of extracted juice, about 4 drachms." (*Civil Surgeon John McConaghey, M.D., Shahjahanpore.*) "The syrup of the fruits is used in diarrhoea." (*Civil Surgeon, R. Gray, Lahore.*) "The decoction of the bark is used as a gargle in salivation, whether brought on by prolonged use of mercury or other causes." (*Civil Surgeon Bankabehari Gupta, Poor e.*) "The ripe fruit is considered curative for calculous affections. The leaves are used as a poultice for scorpion bite." (*Surgeon-Major Robb, Civil Surgeon, Ahmedabad.*) "The vinegar manufactured from the ripe fruit is much used as a stomachic by the natives and is useful in cases of enlargement of the spleen. The doses used are one to two drachms. The fruit is useful in diarrhoea." (*Narain Misser, Kolhe Bazar Dispensary, Hasaribagh.*) "The vinegar of ripe fruit is cooling and used in indigestion. The juice of fresh leaves is used in spongy and painful gums." (*Shib Chundra Bhattacharji, Chanda, Central Provinces.*) "Grows very commonly and is extensively used as an astringent in Mysore." (*Surgeon-Major John North, Bangalore.*)

FOOD.
425

Food.—The fruit, which is sometimes as large as a pigeon's egg and of a purple colour, is eaten by all classes of people: it is sub-acid and rather astringent, and is improved in taste by being pricked and rubbed with a little salt, and allowed to stand an hour. In Goa, a wine, faintly resembling port, is prepared from the ripe fruit.

"A sort of spirituous liquor called *Jambava* is described in recent Sanskrit works as prepared by distillation from the juice of the ripe fruits." (*U. C. Dutt, Mat. Med. Hind., 164.*) The Collector of Madura reports that the fruit should not be extensively eaten as it is apt to bring on fever. Paludanus in a note appended to *Van Linschoten's Voyage*, says:—"This fruit is little used by Physitions, but is much kept in pickle, eaten with Soddien Ryce, for they procure an appetite to meat."

TIMBER.
426

Structure of the Wood.—Reddish-grey, rough, moderately hard, darker near the centre; no distinct heartwood. It is fairly durable. Five sleepers of it were laid down in 1870 on the Oudh and Rohilkhand Railway, and taken up in 1875, when they were reported to be fairly sound and not touched by white-ants. It is used for building, agricultural implements and carts, also for well-work, as it resists the action of water.

DOMESTIC
and SACRED.
427

Domestic and Sacred Uses.—It is often planted as a shelter tree for groves, and, as such, is known under the name of *jamo* in the Saharanpur and Karnal districts. In habit it is very different from the type, and should perhaps be considered as a distinct variety.

"The god *Meṃh* is said to have been transformed into a jambul tree. The colour of the fruit being dark like that of Krishna, this plant is very dear to him; it is, therefore, worshipped, and Brahmins are fed under it. The leaves are used as platters or *panch pallow*s and for pouring libations." (*Lisboa, U. Pl. Bomb., 284.*)

pur," p. 156, referring to this tree, also says:—"The Indians indeed are said to have given its name to their position of the world, *Jambudwip* or the Island of the Jambu tree." It may be here added that the Rose-apple is wrongly referred by Yule, Mason, and others to *E. Jambolana*.

Medicine.—In Bhamo, Upper Burma, the LEAVES are boiled and used as a medicine for sore eyes.

Food.—The fruit, which is usually produced during the rainy season, is about the size of a small apple. By many persons it is highly esteemed on account of its delicate flavour which resembles rose-water, but there is a want of juiciness which renders it unpalatable. In the neighbourhood of Calcutta the fruiting branches are covered with pieces of cloth, and this is believed to increase the size as well as the flavour of the fruit. A preserve is sometimes made of the fruit.

Structure of the Wood.—"Reddish brown" (*Brandis*).

Domestic Use.—In Burma the leaves are said to be much prized for ornamental purposes.

Eugenia javanica, *Lour.*; *Fl. Br. Ind.*, II., 474; *Wight, Ic.*, t. 548.

Syn.—*E. ALBA*, *Roxb.*

Habitat.—A handsome tree, with a profusion of either white or scarlet flowers, followed by an abundance of fruit of the size of a small apple. It is a native of the Malay Islands, and is now cultivated in Bengal and Burma, chiefly in gardens. The Malay looks upon the 'Kavika' tree as representing all that is lovely and beautiful.

The note by Paludanus appended to Linschoten's description of the Rose-apple tree evidently refers to *E. malaccensis*. He mentions the fact of its having been "first brought out of Malacca into India," and he describes the flowers as "of a reddish purple colour," and the fruit "as

466

EULOPHIA, R. Br.; *Gen. Pl.*, III., 535.

The *salep* obtainable in Indian bazars has been ascertained to be the product of two species of *Eulophia*, viz., *E. campestris* and *E. herbacea*, and possibly of others. *Salep* or *sálib misri* consists of the dried tubers of the above-mentioned orchids and of several species of *Orchis*, which latter constitute the bulk of the *salep* of European commerce. Its oriental reputation as an aphrodisiac was founded merely on superstition in connection with the so-called doctrine of signatures. It possesses no medicinal properties whatsoever. A decoction prepared from powdered *salep*, and flavoured with wine and spice, is considered a more or less nutritious and agreeable drink for invalids. Mr. J. G. Baker of Kew, in the discussion which followed the reading of Dr. Aitchison's paper before the British Pharmaceutical Society (December 8th, 1886), said that Dr. Aitchison had practically disposed of the much-debated question as to the source of the *Royal salep* or *badjah*. Mr. Baker, acting on a suggestion made by Hanbury, said that this form of *salep* resembled a bulb more than a tuber, and that he had succeeded in tracing out what appears to be the source of that drug. Dr. Aitchison had brought fresh specimens of these bulbs, and they proved to be *Ungernia trispheera*, a plant belonging to the AMARYLLIDACEÆ. Dr. Dymock writes that the *salep* of Bombay commerce is imported from Persia, Cabul, and Northern India, and is probably obtained from various species of *Orchis*, under which genus further information on this product will be found. (For further information see *Curculigo Orchioides*, Vol. II., 650).

CHEMISTRY.

483

Chemistry.—Dr. Dymock writes the following as the result of his analysis of a specimen of the bark furnished by Dr. G. Watt from Simla:—

“The young branches give a green tincture with spirit and the older bark a red tincture; in each case, on dissipating most of the alcohol and treating with water, a greenish yellow resinous substance falls, and a bright red liquid remains. The resins are soluble in ether and partly in alkalies, and the red astringent supernatant liquor contains tannin, giving a murky green colour with a ferric chloride, and a quantity of saccharine matter. No bitterness was perceived in the extract, and nothing alkaloidal was detected. The aqueous extract of the bark, after exhaustion with spirit, contained a large quantity of a white, neutral, crystalline body, which was dissolved by hot alcohol and crystallized out on cooling. The bark had no marked odour or taste, and afforded a light buff-coloured powder. The powder, treated directly with rectified spirit, gave 45·5 per

The Euphorbias.

494

EUPHORBIA, Linn.; Gen. Pl., III., 258.

A large genus, containing more than 600 species, which are widely distributed over the greater part of the world. They are popularly known as Spurge-worts, a name which is sometimes applied to the whole family. Linnæus is said to have named the genus after Euphorbus, a physician to Juba, King of Mauritania. The species consist of herbs or shrubs, but in some instances they assume the form of small cactus-like trees, with thick, soft-wooded jointed branches. Though differing so widely in general appearance, they can generically easily be recognized by the structure of their flowers. The monœcious flowers are arranged in clusters, and each cluster, consisting of several jointed stamens (male flowers) surrounding a single female flower, is enclosed within a common involucre. All the species abound in a more or less acrid milky juice, which contains active medicinal properties. The most important extract, known under the name of Euphorbium, is obtained chiefly from *E. resinifera*, one of the fleshy-stemmed species, indigenous to Morocco. This resinous substance used to be given as a purgative and emetic, but owing to its extremely powerful action, it is now never used as an internal remedy. Its anticorrosive properties have recently created a demand for it as an ingredient of paint for ships' bottoms. Euphorbium occurs in small roundish masses resembling tragacanth; it is of a light yellow or reddish colour, it has no smell, and its taste, at first slight, becomes painfully acrid and burning.

CHEMISTRY.
495

Its chemical composition, according to Flückiger (1868), is as follows:—

Amorphous resin, $C^{10}H^{16}O^2$	38
Euphorbon, $C^{13}H^{32}O$	22
Mucilage	18
Malates, chiefly of calcium and sodium	12
Mineral compounds	10
	<hr/> 100 <hr/>

"The amorphous resin is readily soluble in cold spirit of wine containing about 70 per cent. of alcohol. The solution has no acid reaction, but an extremely burning acrid taste: in fact it is to the amorphous indifferent resin, that Euphorbium owes its intense acidity." (Flück. and Hanb., Pharmacog., 560.) See also Spens' Encyclop., II., 1649; U. S. Dispens., 15th Ed., 1641; Ainslie, Mat. Med., I., 120.

References.—*Ainslie*, *Mat. Ind.*, I., 599; *O'Shaughnessy*, *Beng. Dispens.*, 565; *U. S. Dispens.*, 15th Ed., 1713; *Irvine*, *Mat. Med.*, *Patna*, 18; *Am. Journ. Pharm.*, XXVI, 305; *Spons*, *Encyclop.*, II., 1414.

Habitat.—A perennial herb with narrow glaucous leaves, a native of Central and South Europe.

Oil.—The SEEDS yield by expression, or by the agency of alcohol or ether, a colourless tasteless OIL.

Medicine.—The OIL formerly found much favour with certain French and Italian physicians as a purgative owing to its tastelessness (when fresh), and because of the small amount required for a dose. In this country the seeds are said to be used in dropsy, and also to procure abortion. According to *Irvine* (*Mat. Med. of Patna*), the imported dried leaves, fruits, and stalks are used as a carminative in dyspepsia, and as a deobstruent.

Domestic Use.—The capsules are said to intoxicate fish.

Habitat.—A large, fleshy-stemmed shrub, or small tree, with smooth roundish, whorled, branches, found in dry rocky places in Northern and Central India; also in Burma. Often planted for hedges.

Medicine.—The MILK has properties similar to those of *E. nerifolia*.

E. parviflora, see *E. hypericifolia*.

E. pilosa, Linn.; Fl. Br. Ind., V., 260.

Habitat.—A tall, erect, perennial herb, found on the Himálaya from Garhwal westward.

Medicine.—This is, no doubt, the plant referred to by Stewart under *E. longifolia, Don.*, and the root of which Honigberger mentions as being used for the cure of fistulous sores.

E. pilulifera, Linn.; Fl. Br. Ind., V., 250.

Syn.—*E. HIRTA, Linn.*

Vern.—*Dudhi, HIND.; Bura keru (Roxb.), buro-keruee (Voigt), BENG.; Pusi-toa, SANTAL; Gordon, C. P.; Nayeti, BOMB.; Dudhi, or mothidudhi, MAR.; Dudeli, GUZ.; Amumpatchay-arissi, TAM.; Bidarie, nanabeeam, nánabála, TEL.; Bá-dada-kiriya, SING.*

Habitat.—A small erect or ascending herb, with acute, hispid leaves (having copious crisped hairs), and small fruits. Found throughout the hotter parts of India from the Panjáb eastward, and southward to Ceylon and Singapore.

Medicine.—[Indian writers have very little to say as to the properties of this plant. They regard it as equal with *E. thymifolia*, but appear never to have learned that either had a special virtue in the treatment of asthma. The following are the only Indian passages the writer can discover that deal with the properties of these plants: "The PLANT is chiefly used in the affections of childhood, in worms, bowel complaints, and cough. Sometimes prescribed also in gonorrhœa" (*S. Arjun, Bomb. Drugs*).

thymifolia.

The Euphorbias.

Attains 15-16 feet; the stems have generally a girth of 2-3 feet, but sometimes of 5-6 feet. The wood is soft and useless." (*Branlis.*) Near Simla the dry white wood is largely used by the poor classes as fuel.

542

Euphorbia, sp.

The dried roots of an undetermined *Euphorbia* are used in Kuram as a purgative. In large doses it causes vomiting, hence it is called the "vomit-weed." The fresh milk of the leaves causes blisters on the hands when collecting the root (*Aitchison, Kuram Valley Flora, in Journal Linnean Society, XVIII., page 25*). May this not be *E. Thomsoniana* referred to by the author in Vol. XIX., l. c., page 147?

543

E. Thomsoniana, Boiss. Fl. Br. Ind., V., 260.

Vern.—*Hirtis* (Aitchison), KASHMIR.

Habitat.—A very distinct plant, with glabrous, simple stems, a foot high, rising from a perennial root-stock. It occurs in Western Thibet, Gilgit, &c., at altitudes of 110,000 to 12,000 feet above the sea. (*Fl. Br. Ind.*)

Medicine.—The crushed root-stocks are employed by the natives of Kuram as detergents for washing the hair, and when boiled are given as purgatives (*Aitchison, Kuram Valley Flora; Linnean Journal, XXIX., page 147*). In Kashmir the root-stock is employed to adulterate "*kut*" (*Saussurea Lappa*), and is called by the Kashmiris "*Hirtiz*." The STEM, ROOT, and LEAVES are said to be used medicinally. (*Aitchison.*)

Domestic Uses.—The root as a detergent

Habitat.—A prostrate hairy annual, common throughout the greater part of India and Ceylon; ascending in Kashmir up to 5,500 feet; often a conspicuous object as a weed on gravel walks.

Medicine.—The JUICE of this plant is known to be a violent purgative. The dried LEAVES and SEEDS are aromatic and astringent, and used in native practice in diarrhoea and dysentery of children along with butter milk (Murray). Irvine (*Mat. Med.*, l.c.) says that it is common everywhere, and is used as a stimulant and laxative. In the Southern Concan, according to Dymock, the juice is used for the cure of ringworm (hence the name *nayeti*); and mixed with chloride of ammonium, to cure dandriff. O'Shaughnessy says that the juice of the stalks and flowers is a violent purgative; that the fresh plant is, by the Arabs, applied to wounds, and the leaves and seeds given by the Tamúls in cases of worms and in the

GUM
594

application being very singular. The body of the patient is first rubbed with green leaves, he is then placed in a small room and bound hand and foot, when a small fire is made of pieces of the wood of this tree from which rises a thick smoke; the patient is suspended over the fire, and remains for some hours in the midst of the poisonous smoke and under the most agonizing torture often fainting. When thoroughly smoked, he is removed, and the slime is scraped from his body, he is then scarified and left to await the result. In some cases he is cured, but frequently the patient dies under the ordeal. (*Smith, Econ Dic*, 5)

Structure of the Wood — White, very soft, and spongy. Grows occasionally to 5 feet in girth and 40 feet in height, though generally cut for posts when of small girth. It is a useful wood for general carpentry purposes, such as toys, bedsteads, tables, &c. Roxburgh remarks that it is only used for charcoal and firewood.

Domestic Use. — Fishing floats are made from the roots of the tree

The Field or Broad Bean : Fagonia.

(G. Watt.)

FABA, Tourn.; Gen. Pl., I., 525.

I

Faba vulgaris, Mœnch.; LEGUMINOSÆ.

THE BROAD BEAN.

Vern.—*Kāitān*, KASHMIR; *Chāstang*, SUTLEJ; *Nakshan*, LADAK. *Bākla*, a name given to it in the plains and lower hills of India.

Habitat and Area of Indian Cultivation.—The *Flora of British India* does not allude to this plant, from which fact the inference is unavoidable that it is not regarded as a native of India. But introduced cultivated plants are usually described in the *Flora*, and the absence of any notice of the Field or Broad Bean may be assumed as an indication that it is supposed to be scarcely, if at all, cultivated in this country. It is, however, to a considerable extent, cultivated on the *Himālaya*, and in *Kashmir* and *Ladak* may be regarded as a regular crop. De Candolle says it has no Sanskrit name nor any modern Indian name. From this circumstance he infers that it is of modern introduction into India. The vernacular names given above would, however, seem opposed to this opinion. Mr. Atkinson states that it is cultivated in *Kumāon* up to 8,000 feet, and that there are two or three varieties raised from "introduced and native seed." Mr. Baden Powell refers to its cultivation in *Kashmir* and *Peshawar*. Balfour goes even still further, and affirms that it "is found wild in the *Sutlej* valley, between *Rampur* and *Sungnam*, at an elevation of 8,000 to 14,000 feet." Stewart, while not supporting the verdict that it is a native of the *Sutlej* valley, speaks of it as a regular crop, adding that "beans are ground into flour for food, and are, on the *Sutlej*, given to cattle." In the Settlement Report of the *Kāngra* District it is alluded to as a regular spring crop. The Director of Land Records and Agriculture in *Bengal*, replying to an enquiry regarding this plant, reports that it is "not yet grown as a field crop in the Lower Provinces." The Director in *Burma*, on the other hand, states that "in *Pegu* District it is cultivated by the Chinese and Shan gardeners in moderate quantities, but has not been taken up as a field crop. This vegetable finds a ready sale in the market. The plant is said to thrive on any land which can be cultivated during the dry season." In the *Indian Forester* (Vol. IX., p. 452) will be found an interesting note on its cultivation in the North-West Provinces. See also in the *Fours. Agri.-Hort. Soc.*, IV., 7; V., 37.

For further information consult the article *Vicia*.

FAGONIA, Linn.; Gen. Pl., I., 267.

A genus of branching woody herbs, of so variable a nature that it is difficult to fix the number of species. Two occur in India—one in the North-West, to *Peshawar*, distributed to *Algeria*; the other also occurs over Northern India, but shows in India a more westerly tendency, being dispersed through the *Pan-jāb* and *Sind* to *Bombay*. It is often difficult to determine to which of these species writers on Economic Botany allude, and the statements made below may therefore have to be rearranged in the future.

8

Habitat.—A tall, delicately-branched annual, growing on perennial roots.
This appears to be the wild plant from which, perhaps both, or at least one

F. 8

FAGOPYRUM
esculentum.

The Buckwheats.

FOOD.
9

of the species of BUCKWHEAT has been derived. It occurs on the temperate Himálaya, frequenting glades between 5,000 and 11,000 feet in altitude. It is distributed from Kashmir to Sikkim and the Khásia Hills. Mr. Atkinson calls this the *ban* (wild)-*ogal*, and adds that in Kumáon it occurs wild on the lower hills.

Food and Fodder.—Although eaten as fodder by cattle, it is commonly reported that this species is not used for any economic purpose. It is, however, so much like *F. esculentum* that it is often doubtful, when in flower, whether the plants met with in glades, near fields, are truly wild, or only escapes from cultivation.

Robertson in *Report, Agri. Dept., Madras*, 1878, pp. 136–137; *Gazetteers: Kangra*, I., 153; II., 57; *Mysore and Coorg*, I., 65.

Habitat.—Extensively cultivated on the Himálaya from Western Tibet to Sikkim, the Khásia Hills, Manipur, and the Nilgiri Hills.

There would appear to be many very distinct varieties, some with white, others with pink, flowers. All are more robust and stunted than *F. cymosum*, but it seems probable that every intermediate condition exists between these two species. A form occurs which seems to correspond to the *F. emarginatum* as described by Stewart, but the writer, not having the opportunity of studying specimens of the various cultivated plants, can do no more than suggest the necessity for such a study. When finally determined, the vernacular synonyms will have to be rearranged. Indeed, so confused are the names given to the forms of Buckwheat, that it is impossible to assign distinctive vernacular terms for two so widely different plants as *F. esculentum* and *F. tataricum*. The latter is a much coarser plant, grows at higher altitudes, and the nut has the angles rounded off instead of being sharp.

CULTIVA-
TION.
II

Cultivation.—On the Himálaya between 4,000 and 10,000 feet *F. esculentum* is a rainy season crop, being sown in July and reaped in October. The forms met with at lower elevations are stunted, and have thick swollen stems of a red shining colour, with pink flowers. In experimental cultivation at the Saidapet Farm, Madras, Buckwheat from Australian seed was sown on the 9th November: it was irrigated several times, and yielded on the 21st January 167lb of grain and 1,138lb of straw per acre. But Mr. Robertson did not apparently form a favourable opinion of Buckwheat as an auxiliary corn-crop. "We have," he adds, "several indigenous grain and pulse crops equal, for ordinary cultivation, to the Buckwheat, if only the ryots could be induced to manure and cultivate better." Mr. Atkinson, speaking of Kumáon and Garhwál, says that Buckwheat "is grown chiefly as a vegetable in the hills and is

F. II

The Buckwheats—Kotu.

(G. Watt)

FAGOPYRUM
tataricum.

recognisable by its red flowers. It is frequently sown in newly-cleared forest lands and ripens in September. The grain is exported to the plains under the name *Kotu*, and is eaten by the Hindus during their fasts (*bart*), being one of the *phalahas* or food-grains lawful for fast-days. It is said to be heating but palatable, and is sold by the *pansārs* or druggists, and not by the general grain dealers. Stewart remarks under *F. esculentum* that the *phalahas* there are at least three or four species in the

Ash	2.3	0 " 161 "

From this result Professor Church concludes that the nutrient-ratio is 1 : 4.7 and the nutrient-value 86.

Mr. Baden-Powell says: "The seeds yield a hard, bitter, and unpalatable BREAD, which is said to be heating: it is only eaten in the plains during the *bart* or fast days."

Bread.

especially on the western extremity and at altitudes from 8,000 to 14,000 feet. It is a taller, much coarser plant than *F. esculentum*, and the nuts, which are long and not triangular, have the angles rounded off and keeled towards the top. It seems probable that there are several varieties, the nut in some being less than half the size in others.

Cultivation.—This seems to be the form grown in Ladak, Zanskar, and Western Tibet. In the Simla neighbourhood it is never seen below 9,000 feet.

Food.—There seems to be little or no difference in taste between this and the previously described species. Stewart says, however, that, if anything, this is inferior in point of quality. Bears are said to be more fond of it than almost of any other food, and they commit much damage to the standing crop. In Lahoul, Aitchison states that "the LEAVES are much used as a pot-herb in summer, when other greens are not easily got."

Professor Church writes: "An imperfect chemical analysis of the fruits or unhusked seeds of the present species shows it to resemble very closely the common kind cultivated in Europe, the albumenoids being 10.9 per cent., the oil 2.4, and the ash 7;" he adds, "the percentage of albumenoids and oil would be considerably raised by the removal of the husk."

Habitat.—A small evergreen tree of Burma and the Andaman Islands to China.

MEDICINE.
Bark.
24

Medicine.—The BARK of this plant is said to be a remedy for malarious fever. In experiments made by Dr. Kanny Lal De, O.I.E., it was found to contain strychnia. The *Pharmacopœia of India* remarks "the remedy appears worthy of further investigation."

TIMBER.
25

Structure of the Wood.—Hard, brown, close-grained, beautifully mottled. It is very durable, and is not liable to the attacks of the "Teredo." It is one of the most important of the reserved trees of Burma, especially in Tavoy; and is used for house-building, bridge and wharf piles, boat anchors, and other purposes. Weight from 53 to 70 lb a cubic foot.

SACRED
USES.
26

Sacred Uses.—The Burmese regard the wood of this tree as too good for the laity, and hold that it should be reserved for sacerdotal purposes. At Tavoy it is employed principally for the posts of Buddhist edifices (*Mason*).

Habitat.—An evergreen tree, often scandent or stem-clasping, found in the forests of the Deccan Peninsula and in Northern and Eastern Bengal, the Khásia Hills, Chittagong, and Burma.

In Burma it is said to be characteristic of the lower hills, and it is also reported to be one of the most beautiful plants found on the lower slopes of the Nilghiris. It is common in the forests of North Kánara, flowering during the rainy season. In Burma the fruit ripens in the cold season.

Structure of the Wood.—Hard and durable. Weight 56 lb.

FARSETIA, Desv.; Gen. Pl., I., 72.

A genus of under-shrubs or herbs, comprising about 20 species; natives of South Europe, West Asia, and North Africa. There are three Indian species which have much the same habitat, possess the same economic properties, and are known to the natives by the same vernacular names; they may therefore be considered collectively.

that of Ostrich Farming. In another volume (under Ostrich) will be found some account of this industry, but it is believed the Trade Returns of Feathers, at the present date, refer mainly if not entirely to the second class of ornamental feathers. Prior to the year 1879-80 the exports from India of ornamental feathers were valued at about 1½ lakhs of rupees. Since that year, however, they seem to have steadily increased. In 1880-81 they were valued at Rs. 69,447; in 1882-83 at Rs. 64,253; in 1884-85 at Rs. 73,017; and last year (1887-88) at Rs. 70,405. The imports are unimportant, the highest record having been in 1886-87, when the imports of

GALL is an absorbent and purgative; it is used along with antimony as a stimulant for the eye. In 1 drachm doses, mixed with 1 drachm of wax, when taken internally, it is said to cause abortion. Bile made into an ointment is used in inflammatory swellings (*Dr. Emerson*).

SPECIAL OPINIONS.—§ "Bile of fish or of the goat is given in night-blindness" (*J. N. Dey, Ferozpoor*). "Black pepper soaked in the bile of pigs for 40 days is given to cure madness" (*V. Ummegudien Mettapollian, Madras*). "Pigment calculi from the gall bladder of the cow, *gorochana*, are much valued by the natives as a medicine, and fetch a very high price" (*W. Dymock, Bombay*).

Felis, see Tiger.

FELSPAR.

Felspar.—The felspar group of minerals is the most important of all the rock-forming materials. Granitic rocks may be said to consist of quartz, mica, and felspar. The disintegration of granite frequently results in the quartz and mica being washed away, with the decomposed materials of felspar left in a more or less state of purity. This constitutes the finest of all known pottery clays. Impure clay may be said to be pure clay adulterated with organic and metallic substances.

Ferns.

(G Watt)

FERNs.

Several works refer to felspar as an economic mineral, such as the Manual of the Coimbatore District, pages 23 and 453, the Manual of Trichinopoly District, page 67; and Mason's *Burma and its People*, pages 583, 734, &c. Since, however, felspar is employed almost entirely in the art of pottery, the reader is referred for further particulars to the article Clay in this work (*Vol. II, pp. 360 to 368*)

oblong or tapering tears, or in broken pieces, varying in size from a pea to that of a soap-nut; generally colourless and transparent, sometimes opaque, with numerous minute cracks on the surface; odourless, bland, and mucilaginous in taste. This gum," he continues, "is very frequently confounded with the Indian Gum Arabic, for it not only bears a great resemblance to it, but there is also a great similarity between the pronunciation of the Tamil names of both, the former being called 'Vildam pishin' and the latter 'Vellam-pishin' (Gum-pishin). Feronia gum being rather scarce and comparatively very dear, the native druggists take advantage of the above facts, and generally pick out the whiter and more transparent pieces from the Indian gum arabic and sell these for the former. The only ready and practical difference between these gums is that the gum of *F. elephantum* is invariably much whiter and more

brownish, dissolved in water it forms an almost tasteless mucilage, much more viscid than that of gum arabic made in the same proportions."

The chemistry of the gum does not appear to have been worked out

110° C. It left 3.55 per cent of ash."

Dye.—At the beginning of the century Dr. Alaisio wrote of the gum "that a celebrated purser mentioned" to Roxburgh "that it answers better for mixing with colours than gum arabic"

DYE.
Gum
55

F. 55

FERONIA
elephantum.

The Wood-Apple.

DYE.

Dr. Warden, in a note to the writer on this gum, repeats the above statement, and *Spens' Encyclopedia* (page 1603) puts the matter even stronger. "For preparing water colours, it has a reputation beyond all other gums. It is much cheaper than gum arabic, while apparently equal to it for all purposes." This statement of the price of the gum would at least appear to be incorrect, and the reputation of the gum as used with paints would seem to rest alone on Dr. Ainslie's original statement.

Balfour gives two sentences which probably allude to one and the same substance. These are: "When an incision is made in the trunk, a transparent oily fluid exudes, which is used by painters for mixing their colours." "It yields a large quantity of a clear white gum, much resembling gum arabic in its sensible properties." So, again, Cooke, in his *Report on Gums, &c.*, of India, while referring to this reputed property, writes that "Dr. Ainslie says that the wood-apple gum is used by dyers and painters, particularly the miniature and chintz painters; it is also employed in making ink and certain varnishes, and by the brick-layers in preparing a fine kind of whitewash." No modern writer has, however, confirmed the frequently-repeated statement of its use to painters. Dr. McCann, for example, in his *Dyes and Tans of Bengal*; Mr. Liotard, in his *Memoir on Dyes and Dyeing*; and Mr. Wardle, in his recent *Report on the Dyes of India*, make no mention of Feronia gum. So also Sir E. O. Buck in his work on the *Dyes of the North-Western Provinces*, while dealing fully with the art of calico-printing and distinguishing the properties of the gums used, does not allude to Feronia gum.

OIL.

56

Essential Oil

57

Oil.—One or two writers mention an OIL, but in such general terms that very little can be compiled of a definite nature on this subject. In the Settlement Report of the Chanda District, for example, it is stated that "oil extracted from the fruit is a remedy against itch." Cooke, in his *Oils and Oil-seeds of India*, says that the seeds are reputed to afford an oil. The authors of the *Pharmacographia Indica* write: "the leaves yield to distillation a small quantity of ESSENTIAL OIL similar to that obtained from *bél* leaves."

MEDICINE
Ripa Fruit.

58

Pulp.

59

Rind.

60

Unripe Fruit

61

Medicine.—The RIFE FRUIT, made into a sort of *chitni*, with oil, spices, and salt, is esteemed by the natives. The fruit itself is an aromatic antiscorbutic, and in the form of a sherbet is sometimes given to children, alone or in combination with *bél* fruit, as a stomachic stimulant. It is supposed to increase the appetite and to possess alexipharmic properties. The PULP is reputed to be especially useful in cases of affections of the gums and throat. It is also often applied externally as a remedy in snake-bite or employed to remove the pain caused by venomous insects. But for this purpose the powdered RIND may be employed if the pulp be not procurable. The Hindus regard the UNRIPE FRUIT as a useful astringent in diarrhoea and dysentery, and Muhammadan authors, for example the writer of the *Makhzan-el-Adwiya*, affirm that the fruit is cold and dry in the second degree, refreshing, astringent, cardiacal, and tonic, a useful remedy in salivation and sore throat, strengthening the gums and acting as an astringent. Elephant-apple is often used to adulterate *bél* fruit, but the two fruits should be easily enough distinguished.

Leaves.

62

The LEAVES are aromatic and carminative, and have the odour of anise (*Ainslie*). The author of the *Makhzan-el-Adwiya* describes them as very astringent and as possessing the taste and odour of Tarragon. Ainslie remarks that the native practitioners of South India (in his day) prescribed the leaves "in the indigestions and slight bowel affections of children."

Bark.

63

Gum

64

The BARK is said to be sometimes prescribed for biliousness.

The GUM has already been alluded to. Ainslie was the first writer to affirm that in medicinal properties the gum of this tree came nearest of

The Wood-Apple.

all Indian gums to the true gum arabic. "The Tamool practitioners prescribe a solution of gum arabic," he says, "to relieve tenesmus in bowel affections, and as we do in other cases requiring demulcents," and he states that for this purpose *Feronia* gum "is commonly used for medicinal purposes by all the practitioners of Lower India."

A fatty oil has been source and nature have according to some writers

MEDICINE.

oil
65FOOD.
Fruit.
66

Surgeon-Major Robb informs the writer that the fruit is used as a condiment. Under the paragraph "Medicine" above it has been stated that a *châtné* is also made of it. In the *Medical Topography of Dacca* it is said that the name Elephant-apple proceeds from the fact that the elephant is very fond of the fruit. "It is," Dr. Taylor adds, "prepared by the natives as an article of diet, by mixing the pulp with salt, oil, and pepper." Dr. Buchanan-Hamilton, in his account of Dinajpur, says, the fruit is eaten by the natives "but is very poor." On the other hand, many writers speak of the fruit in much higher terms. The Conservator of Forests, Northern Division, Madras, in a recent communication, says:—"This tree is common and of good size in the Northern Circars. It is

FERULA.

The Source of Asafœtida.

Ferrum, see Iron.

69

FERULA, *Linn.; Gen. Pl., 1., 917.*

A genus of umbelliferous herbs, comprising some sixty species, a few of which, though growing on perennial root-stocks, attain annually a height of from 8 to 10 feet. Interest in the species of FERULA is mainly centred on the sub-arborescent forms—the Giant Fennels,—which may be said to be characteristic of the dry semi-desert tracts of Central Asia. From these are obtained the various forms of Asafœtida, Galbanum, Sambul, &c. So much confusion even still exists, however, in the literature of these famed drugs, that the writer has thought it the preferable course to give a concise review of the history of Asafœtida and rest satisfied with brief notices under the individual species of FERULA. But even in so far as he will touch only on the species that can be regarded as connected with the Trade and Commerce of India.

HISTORY.
70

History of Asafœtida.—When Dr. Falconer, in 1838, discovered *Narthex Asafœtida* in the valley of Astor, North Kashmir, it was at first supposed that the problem of the source of the drug asafœtida had been solved. The roots procured by him were planted in the Saharanpur Botanic Garden. Seeds were subsequently sent to the Royal Botanic Gardens at Edinburgh. In 1842 these germinated, and in 1859 several of the plants flowered, yielding seeds which were distributed to the various botanical gardens throughout the world. From this source the so-called asafœtida plant in cultivation was derived. It must be observed, however, that while this species yields an asafœtida-like substance, it has by no means been demonstrated that any portion of the asafœtida of European commerce is derived from it. Sir J. D. Hooker figured the plant in the *Botanical Magazine*, No. 5168. He then wrote that it “yields excellent asafœtida in the form of copious milky juice.” But he added, “It would be impossible to discuss here the vexed question of the history of the origin of all the asafœtides, nor would the discussion be very profitable.” Long anterior to Dr. Falconer’s discovery, the German traveller Kœmpfer, in the year 1687, saw asafœtida being extracted from a species of *Ferula* in Lauristan in Persia. He brought to Europe samples of the resin and a fragmentary specimen of the plant from which that resin had been obtained. These specimens were described by Linnæus under the name of *Ferula Asafœtida*. But Kœmpfer’s collections are in the Sloane Herbarium at the British Museum, and were carefully examined by Dr. Falconer, with the result that he entertained a strong suspicion that *Ferula Asafœtida*, *Linn.*, was not the plant he had discovered in Northern Kashmir. He accordingly named his plant *Narthex Asafœtida*. Hooker (*Bot. Mag., l. c.*) wrote that “it is certain that Kœmpfer had two plants (species or varieties) in view, from different countries, that his descriptions and drawings and specimens (in the British Museum) do not tally, and that though Dr. Falconer considers his plant one of Kœmpfer’s, other botanists do not.” The discovery, in the Steppes east of the Caspian, of the plant Bunge named *Scorodosma fœtidum* is also referred to by Hooker. Borszczow, who devoted some attention to the genus *Ferula*, also examined Kœmpfer’s specimens, and came to the conclusion that they should rather be referred to *Scorodosma*. Royle, on the other hand, held the opinion that Kœmpfer’s plant should be assigned to the genus *Narthex*. More recently Boissier referred an asafœtida-yielding species, discovered by him in Persia, to *Ferula Asafœtida*, *Linn.*, and that modern writers regard as *Scorodosma fœtidum*, Bunge, a synonym for *Ferula fœtida*, *Regel*, but view it as most probably not *Ferula Asafœtida*, *Linn.* Dr. Dymock, however, writes to the author that he is disposed to think that *Ferula Asafœtida*, *Linn.*, may prove the same as *Ferula fœtida*, *Regel*.

The learned authors of the *Pharmacographia* are careful to say that it has not been proved that either of the plants reputed to yield the

Two forms of Asafoetida.

(G Watt)

FERULA.

Asafoetida of European commerce is actually the source of that drug. The species they allude to are *Ferula Narthex*, Boiss. (the *Narthex Asafoetida*, *Falconer*), and *Ferula Scorodosma*, Benth. & Trim. (the *Scorodosma foetidum*, Bunge, and *Ferula Asafoetida*, Linn., in Boiss. Fl. Or). Dr.

name of *zing*, and that of *zingra* to the European Asafoetida. In a letter to the writer he says, however, that "the name *Hing* may be applied to any choice asafoetida. *Hingra* means common asafoetida, just as *Rai* in Guzerathi means Mustard and *Kaira* Rape. With the public generally all kinds of asafoetida are *Hing*." Flückiger &

the result, perhaps, of more careful preparation, or due to being derived

juice collected in the manner described by Kämpfer, who witnessed its collection in the province of Laristan in Persia." Dr. Dymock obtained this information, together with a specimen of the plant, from Dr. Peters, but in a correspondence on this subject, he authorises the writer to say that he is now convinced Dr. Peters' plant is *Ferula foetida*, Regel.

Turning to the more recent botanical publications regarding Afghanistan—Dr. Aitchison's various official reports—it is somewhat surprising that that author makes no mention of having seen *Ferula Narthex*. He deals, however, with *Ferula foetida*, Regel, and under that species he places the following synonyms:—*F. Scorodosma*, Benth. & Trim., *Scorodosma foetidum*, Bunge, and *Ferula Asafoetida*, Boiss. He affirms that the

num, &c., &c. The opinion seemed to have been formed that the whole difficulty regarding Asafoetida had been removed.

Two forms of *Asafoetida*.

HISTORY.

In the correspondence with Dr. Dymock (to which reference has been made above), there occurs the following passages, which may fitly be quoted in concluding this brief review: "I think," he writes, "we may regard it as settled that the *asafoetida* of commerce in Europe is all derived from *F. foetida*, *Regel*, growing in Persia and Afghánistan." Dymock retains two species, however, as yielding—the one the Indian, the other the European—*asafoetida* and (following Holmes) gives the synonymy of these species as follows:—

"1. *Ferula alliacea*, Boiss.

Syn.—*F. ASSAFOETIDA*, Boiss. et Bunge, non Linn.

"This produces the *Hing* of Bombay markets—the kind of *asafoetida* preferred as a condiment in India.

"2. *F. foetida*, *Regel*.

Syn.—*F. SCORODOSMA*, Benth. & Trim. (wrongly lettered in their plate No. 127 as *FERULA FOETIDA*, Benth. & Hook. f.), also *SCORODOSMA FOETIDUM*, Bunge, and *F. ASSAFOETIDA*, Boiss. (f. Linn.)

"The selected gum from the bud is called *Kandaharí Hing*, and fetches a high price. The thick opaque gum afterwards obtained from the root is the *asafoetida* of European commerce."

Presumably, therefore, the opaque gum is the *Hingra*, but according to the above notes, the same species furnishes a superior form of *Hing* also. It may accordingly be suggested that perhaps after all certain species of *Ferula* yield either *Hing* or *Hingra*, or both these drugs—the superior and inferior qualities of *Asafoetida*. Future research may reveal the fact that, as with *Cannabis sativa* in affording various resinous substances, so with certain species of *Ferula*, different systems of extraction and manipulation, or diversified conditions of climate and soil, produce both *Hing* and *Hingra*. It is difficult to believe that only two species contribute to the supply of these products, while perhaps half a dozen are alluded to by travellers as affording a milky sap which, on drying, possesses at least the physical properties of *Asafoetida*. It may, however, be safe to affirm that the bulk of the Persian drug imported into India by sea is the *Hing*, derived from *Ferula alliacea*, but that a considerable proportion of the *Hingra* comes also from Persia and Turkistan. The whole of the *asafoetida* that enters India by the frontier land routes from Afghánistan is now satisfactorily proved to be derived from *F. foetida*. This conclusion would seem to be borne out by the trade returns of India, where a far larger quantity of *Hingra* (European *Asafoetida*) is shown to be exported to Europe and other countries than would appear to be imported from Afghánistan by road, rail, and river.

TRADE IN ASAFOETIDA.

TRADE.

71

In the statement of the Trade and Navigation of British India, *Asafoetida* was apparently first separately returned (apart from other minor drugs) in the year 1876-77. Since, however, almost the entire traffic takes place with Bombay, the *Asafoetida* statistics of that Presidency, for earlier years, may be accepted as representing the whole of India. In the report for 1868-69 two forms of *asafoetida* are separately recorded in the Presidency Statistics; these were:—

(a) *Hing*—

Imports from the Persian Gulf . . .	1,538 cwt.,	valued at R 85,118
" " Madras . . .	7 "	" 412
" " Sind (Karáchi) . . .	695 "	" 18,455
These give a total of <i>Hing</i> imported into		
Bombay of . . .	2,240 "	" 1,03,985

Trade in Asafoetida.

(G. Watt)

FERULA.

TRADE.

(b) *Hingra*—

Imports from the Persian Gulf . . . 1,833 cwt., valued at ₹ 18,935
 " " Sonmeance and Meckran . . . 20 " " 114

These give a total of *Hingra* imported of . 1,913 " " 19,049

The *Pharmacographia* quotes the similar returns for 1872-73, viz., 3,367 cwt. of *Hing* and 4,780 cwt. of *Hingra*, but the authors of that work would appear to have regarded the former as the asafoetida of European commerce and the latter a crude article, since they write "the value of the latter is scarcely a fifth that of the genuine kind." Later on they deal with *Hing*, remarking that "among the natives of Bombay, a peculiar form of asafoetida is in use that commands a much higher price than those just described." This mistake is here pointedly

As stated above,

Hingra, but the

In 1876-77 the

collectively were

the present date

the Kábul market. The following may be given as the IMPORTS of Asafoetida into India by land during the past five years —

IMPORTS.
By land.

72

1884-85	1,218 cwt., valued at	₹ 10,043
1885-86	1,775 " "	95,652
1886-87	1,090 " "	53,310
1887-88	1,030 " "	47,192
1888-89	907 " "	37,615

Of these land imports the major portion comes from Kábul, and is presumably therefore derived from *F. foetida*,—the *Hingra*.

The IMPORTS by sea during the corresponding periods were :—

By sea.

73

1884-85	10,340 cwt., valued at	₹ 3,50,076
1885-86	7,228 " "	2,69,893
1886-87	5,704 " "	2,53,103
1887-88	4,521 " "	1,70,073
1888-89	9,504 " "	4,31,502

The figures for the last of these years relate to Bombay : as a rule Sind is the only other province that receives asafoetida by sea (except small quantities imported by Bengal and Madras from Ceylon or Aden), and the imports into Sind were last year 50 cwt., valued at ₹ 797. During the same periods the foreign exports (drawn from the above imports) were :—

EXPORTS.

74

1884-85	2,639 cwt. valued at	₹ 57,471
1885-86	2,530 " "	47,006
1886-87	1,665 " "	42,543
1887-88	1,553 " "	27,431

The figures for the year 1888-89 have not as yet been published. It will thus be seen that, deducting these exports from the total imports (in

F. 74

FERULA.

Trade in Asafœtida.

TRADE.

round figures), about two-thirds of the imported drug remain in India, so that India is itself perhaps the largest asafœtida-consuming country in the world. The highest exports on record were in 1883-84, *viz.*, 4,065 cwt., valued at R86,457, and the following year showed the highest imports, *viz.*, 10,340 cwt., valued at R3,50,076.

In the statement of the Trade and Navigation of British India, however, a trade is shown in exporting asafœtida, which is returned as "Indian produce and manufacture." The writer is utterly at a loss to understand what this can mean. He is not aware that any asafœtida is produced in India, and therefore (as with camphor) it seems probable that the drug undergoes some process of "manufacture," more probably a systematic adulteration than a purification. There are two features of this so-called Indian asafœtida that may be here mentioned. It goes entirely to the United States of America, Australia, and Mauritius; none of it to Europe or China. It is exported from Calcutta or Madras; none of it from Bombay—the port that supplies Europe and China. The trade in the so-called Indian asafœtida fluctuates very considerably, but it seems to have been steadily declining for some years back. In 1879-80, however, it amounted to 1,130 cwt., valued at R23,698, and of this the United States took 913 cwt. In 1884-85 it amounted to 1,343 cwt., but the average of the past ten years does not much exceed 300 cwt., and in 1887-88 the trade had decreased to 4 cwt., 3 of which went to Australia.

PRICES, &c.

75

PRICES, DESCRIPTION, &c.—The declared value of products in trade statistics are not often of much practical importance, since dealers may be presumed to give a valuation of their articles which best suits their own interests. Viewing the figures given above, remarkable fluctuations in the declared values will be observed which are, to some extent, doubtless due to the reason given above. The article varies much, however, according to supply and purity. Dr. Dymock says of *Hingra* "the imports into Bombay are about 2,500 cwts. annually from Persia and Afghanistan. Value R10 to R20 per Surat maund of 37½ lbs." There would seem to be some mistake as to this estimate of the extent of the Bombay imports of *Hingra*. Last year (1888-89) the imports by sea were 5,042 cwt. and from Kábul 907 cwt. An average of 5,000 cwt. of *Hingra* would thus appear a safer estimate. Dr. Dymock next deals with Khandahari *Hing*, which he concludes is derived from the same plant as *Hingra*. He says it comes into "the Bombay market in small quantities; it is sewn up in goat-skins, forming small oblong bales, with the hair outside. When it first arrives it is in moist flaky pieces and tears, from which a quantity of reddish-yellow oil separates on pressure; the gum-resin is also of a dull reddish-yellow colour, soft and somewhat elastic; with an odour recalling that of garlic and oil of caraways. By keeping, it gradually hardens and becomes brittle and of a rich red-brown colour; the odour also becomes more purely alliaceous, and approaches to that of the commercial kind." "This kind of *Hing* is entirely consumed in Bombay by the manufacturers of adulterated asafœtida, its strong odour and flavour making it especially valuable for this purpose. The average value is R25 per Surat maund of 37½ lbs." The ordinary form of *Hingra* (good quality) "occurs in tears or flat pieces, upon the under-surface of which particles of sand often adhere; the external surface is yellowish, but the fresh fracture is of a pearly white, which, by exposure to the air, becomes bright pink and finally dirty yellow. Inferior samples consist of agglutinated tears, with a certain proportion of moist brown clammy gum-resin filling up the interspaces between them. Sometimes the asafœtida which comes from Persia is a homogeneous, soft, white, mass like clotted cream; these parcels upon exposure to the air develop

Persia in the neighbourhood of Djendack and Yezd, and in Khorassan near Seharud, Nischapur, Meshed, Dehrachtindjan, and Kerman (Buhse). Called *Angushch* in Khorassan and *Zendebug* in Kirman (Boiss. *Fl. Or.*, 995). It grows on stony arid soil, and to an altitude of 7,000 feet.

Cultivation.—Grows wild; is not cultivated.

GUM-RESIN.

COLLECTION.—The following description is given by Dr. Dymock (*vide Mat. Med. of Western India*, p. 382), on the authority of a merchant of Yezd, who had personally seen the process going on:—

"The hill-men collect the gum-resin, taking an advance from the merchants. The time for collecting it is in the spring." "The collectors protect each plant by building a small cairn of stones round it; they also remove the soil from the upper portion of the root, making a kind of circular basin. When the stem begins to grow it is cut down, and the upper part of the root being wounded, a small quantity of very choice gum is collected, which seldom finds its way into the market. Afterwards, a slice of the root, about $\frac{1}{4}$ inch thick, is removed every two or three days with the exudation adhering to it, until the root is exhausted. The collected mass, consisting of alternate layers of root and gum-resin, when packed in a skin (in quantities of about 100lb), forms the *Hing* of Indian commerce."

CHARACTERS.—The gum-resin, as found in the market, consists of a blackish-brown, originally translucent, brittle mass of extremely fœtid alliaceous odour, unadulterated by earth, or gypsum, but always containing slices of the root. Dr. Dymock mentions that in Bombay it is often adulterated by the addition of gum arabic, and that the cheaper sorts contain an undue proportion of the root. This is produced by the exhausted root being cut up and mixed with the gum-resin and water. Recently, adulteration with sliced potato has been observed.

The term "*hira-hing*" is said to be applied to a liquid of treacly consistence, often found in the centre of the bales, which is squeezed out and sold at a high price. (*Spons' Encyclop.*)

CHEMICAL COMPOSITION.—The essential oil is very abundant, and differs from that of *Hingra* in having a reddish hue, being of higher specific gravity, and having a much stronger rotatory power.

An alcoholic tincture is not precipitated by acetate of lead, nor is the sulphuric acid solution fluorescent. In all these respects there is consequently a well-marked difference between *Hing* and *Hingra* (*Flückiger and Hanbury*).

MEDICINE.—This drug is very much used in India, and has, from the earliest times, been held in great esteem by eastern doctors. It is reputed a carminative and antispasmodic, and therefore as useful in colic, cholera, &c., and when taken daily it is said to ward off attacks of malarial fever. Hindú medical writers direct it to be fried before being used. The Muhammadans place asafœtida amongst their aphrodisiacs and hypnotics, and consider the FRUIT to be stimulant (*Dymock*). Waring, in the *Pharmacopœia of India*, writes, "it produces excellent effects in the advanced stages of pneumonia and bronchitis in children." Information collected from medical men in various parts of the country shew that the drug is considered useful as a carminative in colic and flatulent dyspepsia, as an anthelmintic in cases of round worm, and as an emetic. It is also described by two writers as a useful local anæsthetic in hemicrania and dental caries.

SPECIAL OPINIONS.—§ "*Hing* is said to be used internally in guinea-worm and colic. Dose 5 to 15 grains, made into a paste with water; it is used as an external application to frontal headache" (*Joseph Parker, M.D.*,

CULTIVATION.

85

Cultivation.—It is described by Aitchison and others as growing freely of itself, without any cultivation, in the sandy deserts of the countries given above. Dr. Aitchison in his paper on "Some Plants of Afghanistan, and their Medicinal Products" writes,—“The country in which these *UMBELLIFERÆ* flourish consists of the great shingle and conglomerate plains lying between the hills and the beds of the rivers, which are broken up by numerous ravines and traversed by what are usually dry water-courses, which once in every two or three years, on the occurrence of heavy falls of snow on the hills above, or local showers of rain, suddenly become roaring torrents. The altitude of these plains above the sea-level ranges from 2,000 to 4,000 feet. These plains during winter are perfectly treeless and bare, the only signs of a past vegetation being the gnarled remains scarcely over a foot in height, of a few shrubs.” “In early spring great cabbage-like heads are to be seen distributed at intervals amongst the asafoetida plants. Their peculiar forms represent the primary stages of the flower-heads, enclosed and completely covered up by the large sheathing stipules of its leaves.” From these the tall flowering stalk arises and the circular mass of foliage springs out, after which the plant assumes its fully grown appearance. Only about one plant in a hundred is said by Aitchison to bear a flowering stem. The only localities in India offering the natural conditions required for the growth of *F. foetida* are perhaps parts of the sandy deserts of Rajputana, Sind, and the Panjáb. The remark, therefore, in *Spons' Cyclopadia*, drawing the attention of planters in India to the simplicity of its cultivation, seems rather out of place.

GUM-RESIN.

86

Collection.

87

Gum-resin.—Forms the drug of commerce known in Europe as asafoetida—in India as *Hingra*. The process of collection has been variously described by Koempfer, Bellew, and others. Dr. Aitchison's account, being the most recent, is here given at length:—

“The method of collecting the drug, as far as I could learn, was as follows. A few men, employed for the purpose by some capitalist at Herat, are sent to these asafoetida-bearing plains during June. These take with them provisions consisting of flour and several donkey-loads of water-melons, the latter in lieu of water, which is not only scarce there, but usually saline. The men begin their work by laying bare the root-stock to a depth of a couple of inches of those plants only which have not as yet reached their flower-bearing stage. They then cut off a slice from the top of the root-stock, from which at once a quantity of milky juice exudes, which my informant told me was not collected then. They next proceeded to cover over the root by means of a domed structure of from 6 to 8 inches in height called a *khora*, formed of twigs and covered with clay, leaving an opening towards the north, thus protecting the exposed root from the rays of the sun. The drug collectors return in about five or six weeks' time, and it was at this stage that the process of collecting came under my personal observation. A thick gummy, not milky, reddish substance now appeared in more or less irregular lumps upon the exposed surface of the root, which looked to me exactly like the ordinary asafoetida of commerce as employed in medicine. This was scraped off with a piece of iron hoop, or removed along with a slice of the root, and at once placed in a leather bag,—the tanned skin of a kid or goat. My guide informed me that occasionally the plant was operated upon in this manner more than once in the season. The asafoetida was then conveyed to Herat, where it usually underwent the process of adulteration with a red clay *tawah*, and where it was sold to certain export traders called *Kákri-log*, who convey it to India. On August 17th, when I crossed the great asafoetida plains, where this drug is chiefly collected, except for the small domes over each root there was not a leaf or a stem or anything left to point to the fact

Asafoetida—Hingra.

(J Murray)

FERULA
foetida.

that any such plant had ever existed there, the heat and winds of July and August having removed every trace" (*The Pharmaceutical Journal and Transactions*, December 21st, 1834)

Bellew, in his account, says that after cutting the plant through, above the root, three or four incisions are made in the stump. The operation of incision is repeated every three or four days, so long as the sap continues to exude. Bellew also describes the quantity of asafoetida obtained from each root as varying from a few ounces to two pounds, according to the thickness of the roots, which vary from the size of a carrot to that of a man's leg. The resin is called by the natives near Herat *angusa*. A particular sort is mentioned by Bellew as being "obtained solely from the node or leaf bud in the centre of the root-head of the newly sprouting plant." This kind is never adulterated, and sells for a much higher price than the ordinary adulterated form. This is probably the fine quality of the drug known as *Khindahari-hing*.

The common form of *Hingra* is much adulterated by the *tjwah* above mentioned, by wheat or barley flour, and by powdered gypsum. It is also mixed with slices of the root. The asafoetida obtained from this species of plant, with the exception of the *Khindahari Hing*, is not used in India. It is nearly all exported to Europe, where it forms the drug of commerce.

GUM-RESIN.

Characters
88

persistent alliaceous odour and a bitter acrid alliaceous taste.

CHEMICAL COMPOSITION.—Asafoetida consists of resin, gum, and essential oil in varying proportions, but the first generally amounts to more than half. The resin is partly soluble in ether or chloroform. The essential oil is volatile and may be separated out of asafoetida,

FERULA
galbaniflua.

Galbanum.

95

(G. Watt.)

Ferula galbaniflua, *Boiss et Buhse.*

The drug known from historic times as GALBANUM is now believed to be derived from one or two species of *Ferula*, chiefly *F. galbaniflua*, *Boiss et Buhse*; *F. rubricaulis*, *Boiss.*, according to Borszczow, is also a source of the drug.

Vern.—*Bircja, gan la-biroza* (the last name is also given to the turpentine of *Pinus longifolia*), HIND.; *Badra-khna, berisfeh* (the gum, *jaos-shir*), ARAB.; *Bazad, kuinch*, ARAB.; *Jawashir, khavvuch, gaosshir, birceez*, PERS.

According to some Muhammadan writers this is the *Khalbani* of the Greeks (*περι χαλβανι* of *Dioscorides*).

References.—*Aitchison, Phurri, Jour. and Trans., 3rd Ser., XVII., p. 466* (London 1887), also *Delim. Comm. Report (Trans. Linn. Soc. III. (2nd Series), p. 64)*; *Dymock, Mat. Med. W. Ind., 2nd Ed., 360*; *Flück. & Hanb., Pharmacog., 320*; *Bent. & Trim., Med. Pl., 128*; *Kew, Off. Guide to the Mus. of Ec. Bot., 75*.

Habitat.—A native of Persia, from which the gum is imported into Bombay and re-exported to Egypt and Turkey. Dr. Aitchison says this is one of the most characteristic plants of certain tracts of the Badghis, specially common around Gulran. No other plants are to be seen for miles, the young leaves on the top of the perennial stems appearing like cushions of moss.

Gum-Resin.—The *Jaos-shir* resin, as met with in India, is not dry agglutinated tears, but a yellow or greenish semi-fluid resin, generally mixed with the stems, flowers, and fruits of the plant. It has an odour between that of Levant Galbanum and Sagapenum. It is not used in India. Dr. Aitchison remarks: "The stem, on injury from its earliest stage of growth, yields an orange-yellow gummy fluid, which very slowly consolidates, usually forming on the stem, like the grease on a guttering candle, and possessing, in common with the whole plant, when crushed, a strong odour resembling that of celery. The gum is commonly found adhering to the lower portions of the stem, and is so tenacious that when subsequently examined pieces of the plant are frequently found attached to it. No artificial means are employed to my knowledge in the collection of this drug. It is stated to be an article of export through Persia, *viz.*, the Gulf of Arabia and India."

Medicine.—The *Jawashir* or (*Gaoshir*) was not identified by the Arabs and Persians with the Galbanum of the Greeks. The *Ganda-biroza* of the Indian bazárs is the turpentine of *Pinus longifolia* (which see). Muhammadan writers (e.g., the *Makhean*) describe the Persian *Gaoshir* as a foetid gum-resin, and say it is used medicinally as an attenuant, detergent, anti-spasmodic, and expectorant; prescribed in paralytic affections, hysteria, and chronic bronchitis (*Dymock*). Aitchison writes that "in Persia and Afghánistan it is said to be administered to parturient women, and the entire shrub is hung round the house to keep off evil spirits whilst parturition is actually taking place."

The ordinary Galbanum of European commerce is the Levant resin—for the chemistry of which see the *Pharmacographia*.

SPECIAL OPINIONS.—§ "Oil distilled from the gum is used in gonorrhœa; it is an excellent substitute for Copaiba" (*Surgeon Anund Chunder Mukerji, Noakhally*). *Ganda Biroza*, I have been told, is useful as a topical agent to promote the absorption of inflammatory products; it may be employed thus with advantage in bubo and inflammatory enlargements generally" (*Surgeon F. Ffrench Mullen, M.D., I. M. S., Saidpore*).

Trade.—According to *Dymock* *Jawashir* is imported into Bombay from Persia, where it is said to be collected between Shiráz and Kirmán.

The Fescue Grasses.

(J. F. Duthie.)

FESTUCA, Linn. ; Gen. Pl., III., 1189.

A large genus, and widely distributed in temperate and alpine regions. Some of the species, such as Meadow Fescue and Sheep's Fescue, are reckoned amongst the most valuable of European pasture grasses. The generic name is said to be derived from the Celtic word *fest*, meaning pasture or food.

107

Festuca elatior, Linn.

References.—Mueller, *Select Pl.*, 173; Sutton, *Permanent and Temporary Pastures*, pp. 36 and 41; Stebler and Schrotter, *The Best Forage Plants* (Eng. Ed.), 35.

Habitat.—A tufted perennial species, with stems upwards of 3 feet, met with occasionally on the North-West Himálaya. Professor Hackel, in his monograph of the Genus, divides *F. elatior* into two sub-species, *vis.*, *pratensis* (the true Meadow Fescue), and *arundinacea*, which is a taller and coarser plant.

FODDER.

108

Fodder.—Meadow Fescue has a great reputation, both in Europe and America, as being one of the most valuable grasses for pasture as well as hay. It thrives best in soils rich in humus and where the climate is damp. Cattle are said to prefer it even to Fox-tail (*Alopecurus pratensis*).

109

F. gigantea, Vill.

Syn.—BRORNUS GIGANTEUS, Linn.

Habitat.—This species is found at moderate elevations on the North-West Himálaya.

Mueller (*Select Plants*, page 174) describes it as a good perennial forest grass.

110

F. ovina, Hackel. (This includes *F. ovina*, Linn.)

References.—*Treasury of Bot.*, I., 450; Sutton, *Permanent and Temporary Pastures*, 45, 47; Stebler and Schrotter, *The Best Forage Plants*, 88; Mueller, *Select Pl.*, 174.

Habitat.—This species is easily distinguished by its compact growth and close-tufted bristle-like foliage. It occurs abundantly on the Himálaya, up to 15,000 feet, and in Kashmir. It is extremely variable and has been divided by Professor Hackel into five sub-species and several varieties, of which the following are represented in India.

Sub-species *eu-ovina*, Hack., var. *vulgaris*. This is Linnæus's *F. ovina*, and the true Sheep's Fescue. According to Sutton it is the smallest grass cultivated for agricultural purposes. Owing to its hard wiry foliage it is useless for hay, but being nutritious, it affords excellent pasturage for sheep. Another variety of this sub-species is *durinscula* (*F. durinscula*, Koch) or Hard Fescue, so called on account of the hard nature of the florets when ripe. It has stouter stems, larger spikelets, and thicker leaves than those of the preceding variety and is altogether a more robust plant. It is also a most valuable constituent of sheep pastures in localities where the soil is too poor for the growth of better grasses.

Sub-species *subcata*, var. *Valeriaca*, (Hack.), is distinguished from the above varieties by having glaucous leaves and stems, and the leaves when dry become furrowed.

III

F. rubra, Linn.

CREEPING OR RED SHEEP'S FESCUE.

References.—Sutton, *Permanent and Temporary Pastures*, 48; Stebler and Schrotter, *The Best Forage Plants*, 107.

Habitat.—A perennial grass, distinguished from the other species of fescue by its creeping habit. It occurs on the Himálaya at moderate elevations.

FODDER.

112

Fodder.—This is said to be one of the few grasses which improve as they get older, the leaves and stems being actually more nutritious, as well

F. II2

The Fibrous Materials of India.

FIBRES.

as of superior bulk, at the time of ripening seed than earlier in the season (Sutt n. l. c). It thrives on various kinds of soil; and on loose sandy ground and railway embankments it spreads rapidly by means of its underground stems, and serves to bind the soil. Royle says that, owing to the greater produce it affords, it is more valued than Sheep's fescue.

Vern.—*Napeo*, MANIPUR

115

Habitat.—An extensive climber, common in the forests of Manipur

We are, however, unable to give a detailed description of the plant, but as only one species (*F. tinctoria*, Lour.) has been hitherto published, there seems no doubt this will prove distinct.

Dye.—Major Trotter narrated the process of dyeing from this plant as follows:—"Five chittacks of dry root of the *napeo* plant to be washed clear and beaten into long shreds, then soaked in 2½ quarts of water for 15 or 20 minutes, when it will be found that the water has become of a yellow colour, this water should be put aside, as it will be required later on. Take out the pounded roots and re-steep in the same quantity of fresh water and let stand for 24 hours. Then wash the cloth to be dyed clean, thoroughly soak it in the first solution and take out and repeat the process in the second water, leaving the cloth to soak in it for about half an hour; then wring out and steep in half a pint of *Aeshooag* (*Garcinia pedunculata*) water, pressing and flipping it about in the vessel, so that every part of it may become thoroughly saturated with this water, then wring out and dry in the shade."

116

FIBRES.

117

A detailed list of the fibres and fibrous plants of India will be found in the appendix (See the explanation made under **FOONS** and also **DOMESTIC** and **SILKEN PRODUCTS**). It may be here stated that fibres are classified into:—

I.—Vegetable Fibres.

A.—Bark fibres suitable for the higher textile purposes (e.g., *Rhea* (See I. India, (See S 322)

F. 117

FICUS
annulata.

The Banyan Tree.

FIBRES.

B.—Bark fibres suitable for the lower textile purposes, e.g., Jute (See *Corchorus*, Vol. II., 534—562). Sun-hemp (See *Crotalaria juncea*, Vol. II., 595—614), and Coir (Vol. II., 415—459). Manilla-hemp, *Bauhinia* (See Vol. I., 424—425; also *Selections from Records of the Government of India*, Vol. I., 183—186), *Hibiscus*, &c.

C.—Bark fibres suitable for Cordage and Ropes (See Vol. II., p. 566).

D.—Paper materials.

E.—Flosses, e.g., Cotton, Silk Cotton, Kapok, &c., &c. (See *Selections from the Records of the Government of India*, I., 323—339).

II.—Animal Fibres.

F.—Wool (See *Selections from the Records of the Government of India*, Vol. I., 23—52).

G.—Silk.

H.—Hair, Pashm, &c.

III.—Mineral Fibres.

I.—Asbestos, &c. (See Vol. I., 338).

Certain information will be found under each of these sectional headings, in their respective places in this work; but to discover the descriptions of all the fibrous material of India the enumeration given in the appendix must be consulted, which will afford the key to the numerous articles on fibres scattered throughout the Dictionary.

(Murray & Watt.)

FICUS, Linn.; Gen. Pl., III., 367.

A genus of trees, shrubs, or climbers, sometimes epiphytic, comprising about 600 species, mostly tropical, of which, according to *Hooker's Flora of British India*, 112 are Indian.

The chief interest, economically, in the species of *Ficus*, arises from the fact of their having a milky sap which contains Caoutchouc,—*F. elastica* being one of the sources of the India-rubber of Commerce.

I18

Ficus altissima, *Bl. Bijl.*; *Fl. Br. Ind.*, V., 504; *Wight, Ic.*, t. 656; *King, Ficus*, 30, t. 30, 30A, 31, 82, 82¹; URTICACEÆ.

Habitat.—A large spreading tree, with few aerial roots. Found in the Tropical Himālaya from Nepal to Bhutan; in the plains and lower hills of the Deccan and Ceylon; and from Assam to Burma and the Andaman Islands. According to *Gamble* this tree is epiphytic.

CAOUTCHOUC
I19

Caoutchouc.—In the *British Burma Gazetteer*, its Caoutchouc is said to be as good as that of *F. elastica*. *Brandis* remarks of it that it merits further examination. *Gamble* says it yields caoutchouc more sparingly than *F. elastica*, and of inferior quality. In Sylhet lac is collected from the branches of the tree.

Banyans are found growing in every part of that province. They are a sort of fig tree, with large, flat, and seeds down roots from its trunk, the trunk itself expanding into horizontal growth. The branches from the different stems may often become so increased in thickness as to exceed those from the original axis, and here and there this occurs to such an extent as to form aerial stems. The tree originates usually from the green stem or seed dropped by birds on other trees. Very often, owing to the water-roots formed by the axils of the leaves of palms (particularly the *Palmira* and *Dacq.*), the fig may be observed embracing, until it strangles, a crown of palm-leaves which are seen to grow from the centre of the *Banyan*. The death of the supporting palm, leaves a decaying central mass, which in time (or with the maturity of the *Banyan*) results in the death of the original axis, but the daughter axes continue their forest-like expansion until an area is embraced sufficient to afford shade for many thousands of people. Colonel Sykes described a very large *Banyan* which grew on an island in the River Nerbudda. This was known as the Kabir-lar, and was probably the large tree described by Nearchus. In the *Peona Gazetteer* (*Vols. XVIII., Pt. I., p. 51*) a *Banyan* is spoken of in the Andhra valley, so large as to afford shade to 20,000 people. Forbes describes its circumference as of 2,000 feet, and its overhanging branches, beyond the daughter stems, as stretching over a much larger area. It had about 300 large trunks and over 2,000 smaller, and was capable of sheltering 7,000 men. High floods have, however, since carried away portions of the island, and with these sections of this great tree. Better known examples are the famous *Banyan* in the Royal Botanic Gardens, Calcutta, and the Satara one in Bombay. Dr. King describes the Calcutta banyan as about 160 years old, and as possessing 232 aerial roots. The main or parent trunk of this remarkable tree, he says, has a girth of 42 feet; the circumference of its leafy crown being 857 feet. It is, however, still growing vigorously, and as Dr. King remarks, "there is no reason why it should not go on increasing indefinitely." It is known to have taken its birth about the year 1782, on a sacred date-palm. Mr. Warner describes the Satara banyan—a still larger example than the Calcutta one. In 1852 its circumference was 1,587 feet, its length from north to south 595 feet, and from east to west 442 feet.

The Banyan is a favourite road-side tree and is accordingly largely planted for shade. In the Panjáb the young trees are said to require protection from frost. Both this tree and *F. religiosa* effect serious destruction to buildings, especially in Bengal. Bird-droppings, containing the seeds from the fruits, germinate on the walls of temples and other buildings,

Fibre.—A coarse rope is prepared from the BARK and from the AERIAL
ROOTS. Paper is also reported to have been formerly largely prepared in
Assam from the bark, and to a small extent it is still so prepared at
Lakhimpore and in Bellary in Madras. This fibre was used by the
Sikhs as a slow-match. The length of the ultimate fibres has, by Cross,
Bevan, and King been ascertained to be 1—3 mm. The fibres obtained
from the genus *Ficus* contain from 40 to 60 per cent. of cellulose, and
under hydrolysis lose from 20 to 40 per cent. of their weight. Chemically
they are therefore worthless fibres (See *F. infectoria* and *F. religiosa*).

SPECIAL OPINIONS AS TO FIBRE.—“The inner bark is an article of
common use for cordage, &c., in the rural districts” (J. Cameron, *Super-
intendent, Botanical Garden, Bangalore*). “Used for tying bundles of
wood, &c.” (Dr Dymock *Bombay*).

Medicine.—The MILKY JUICE is externally applied for paps and
bruises and as an anodyne application in rheumatism and lumbago. It
is considered as a valuable application to the soles of the feet when
cracked or inflamed, and is also applied to the teeth and gums as a reme-
dy for tooth-ache. An infusion of the BARK is supposed to be a powerful
tonic and is considered to have specific properties in the treatment of
diabetes. The SEEDS are deemed cooling and tonic. The LEAVES are
applied, heated as a poultice, to abscesses, and after they have turned
yellow are given with roasted rice in decoction as a diaphoretic. The

FICUS Benamina.

The Banyan Tree.

TIMBER.
I41

Structure of the Wood.—Grey, moderately hard; no heartwood. Weight about 37lb. It is of little value, but is durable under water, and therefore used for well-curbs. It is sometimes employed for boxes and door panels. The wood of the drops is stronger and is used for tent-poles, cart-yokes, and banghy-poles (*Gamble*). Kurz and Brandis describe the wood as whitish, open-grained, and soft.

Domestic Uses.—The LEAVES are much in demand as plates. The milky JUICE is in Lahore employed to aid in the oxidation of copper.

DOMESTIC.
Leaves.

Sacred Uses.—According to Hindu mythology, Bráhma was transformed into a *Vada* tree. Dr. Buchanan says that the Banyan is viewed as the male to the Peepul. It is regarded as a sin to destroy either of these trees, but more especially the male. It is meritorious to plant a young male close to the female, and this is done with a ceremony somewhat similar to that of marriage. It is customary, he adds, to place a piece of silver money under the roots of the young Banyan tree. So superstitious are the Hindus against cutting down the Banyan tree, that a Mr. T. Marsden, of the Madras Engineers, is said to have been poisoned by the Brahmans of Tripasore, in 1771, because he had cut down a Banyan tree during the construction of the fort. Lisboa writes that the dry twigs are used as *Samidhas* for producing sacred fire. The leaves are employed as one of the *Panch pallavs* or platters, and also for pouring libations. In the *Vratrag* females are ordered to worship this tree on *Fesht shudh* 15th (May), to water it, to wind a thread round it, and to worship it with *gandh* flowers, &c. (? the Indian Marigold—see Vol. II., p. 24 and p. 272; also *Tagetes erecta*. On the Himálaya the introduced but now completely naturalised *Dahlia* is similarly used). They are further ordered to make *Pradakshanas* (i.e., to go round it a certain number of times, to praise it, and to pray to it for the survival of their husbands and for the fulfilment of their wishes). They are told that by worshipping this tree they attain one of the heavens—*Shivloke*. They are encouraged to this worship by the tradition that *Savitri*, the wife of *Satyawan*, got back her deceased husband through the adoration of this tree. They are recommended to perform the thread ceremony of this tree and its marriage with the *Durva* plant—*Cynodon Dactylon*.

The umbrella poles often used at ceremonies are made of the wood of the aerial roots, and the young thin roots are by the Santals and other aboriginal tribes of Chutia Nagpur wound around the neck as a charm to ensure conception.

Habitat—Cultivated in many parts of India, more especially in the North Western Provinces, the Panjáb, the Western Himalaya, Sind, and Beluchistan. Reports have been received of its cultivation in Bombay, Madras, Burma, and the Andaman Islands. In some of the references, however, room for doubt seems to exist as to their really referring to this species. Dr. Aitchison thinks *F. Carica* is probably a native of Afghanistan and Persia. It is indigenous, he says, in the Badghis country and Eastern Persia. According to DeCandolle, "the prehistoric area of the

Cultivation—In the Bombay Experimental Farm reports repeated mention is made of the cultivation of this fig, but the following special report by the Director of Land Records and Agriculture, Bombay, gives the results of the experience gained at Poona—

"In 1887-88 the area under figs amounted to 271 acres. With the exception of a few acres in Surat, Ahmadnagar, and Belgaum, almost the whole area was confined to Poona. There are two varieties—dark purple and greenish. The tree grows from 6 to 7 feet high.

"The fig tree does not require very rich soil. Alluvial or loamy soil of yellow or reddish brown colour, with a rocky or *murum* bed 3 or 4 feet below the surface, is best suited to its growth. The rocky or *murum* bed prevents the roots from penetrating deep into the soil, and favours the side growth of rootlets, which is very desirable. Fig trees also thrive in clayey soil, but the land must not be water-logged. Rich black soil is

CULTIVA-

150

FICUS
Carica.CULTIVA-
TION.

The Fig.

medium to high trees. In it the plant grows tall and runs to leaf, and the fruits ripen and are of the most excellent taste.

The crop requires a mixed manure, about 10 to 12 cart-loads for the first year. The ingredients of the mixture are town sweepings, sheep-droppings, cow-droppings, and other. The use of each of these ingredients separately is not beneficial provided. Sheep droppings make the skin of the figs tender, and the other ingredients are of little use. Cow-droppings, however, do not harm the tree. The use of sheep by themselves is considered injurious to the plant. Dry fish bones a very good manure but is not easily procurable. Protracted frost is to be feared.

The plants are raised from cuttings 1 to 1 1/2 inch thick and a foot or 1 1/2 feet long, planted in rows 10 to 12 inches apart in a richly manured soil. The cuttings should be put into the ground as they are taken from the stock and set in and should be watered every eighth, sixth, or fifth day as necessary. In about two months they begin to throw roots and shoots and make a few leaves. If they are properly taken care of the plants after a year become fit for transplantation, either in rows they take from 10 to 12 months more. The best season for transplantation is July-August. To allow of free growth and to prevent the tree from becoming too thick and injury from shade, the plants should be at least 12 to 14 feet apart. About 25 plants go to an acre.

At the end of every August, when there is a break in the rains, the soil on the roots of the plants should be turned up and loosened, the outermost branches cut and the remaining roots exposed to the sun for four or five days. The roots should then be covered with a little earth and one or two bushfuls of manure, and the plants watered. The whole operation should not extend over a fortnight. A little manure is sometimes applied but none should be given after October. From the beginning of March to the end of May the soil should be slightly turned and cleared every fortnight. In this way the soil should be dressed about 20 to 25 times a year. If the plant turns to wood and leaf and does not bear, it should be pruned, slightly manured, and watered every fortnight.

The fig tree requires careful watering. In the fruiting season, the failure of a single weekly watering reduce the outturn. The quantity of water should also be gradually increased, and the period between two waterings should begin with four days and end with eight days, having an intermediate period of six days. The watering should commence with September and end with the fruiting season. During the first two years light crops may be raised between the lines of fig trees. In the first year, onions, garlic, and other vegetables may be cropped, and in the second year, radish and fenugreek. But from the third year, when the plant begins to bear, no crop should be raised. The plant begins to bear in the second or third year after transplantation. But the full crop can be gathered only from the fourth year. The tree continues to bear from 12 to 15 years; and 20 years is the utmost limit, after which the tree generally dies up. Vigorous growth of the plant in September-October is a sure indication of a good crop. The tree fruits twice a year. The first season commences in June-July, but the crop is not allowed to ripen, as it, besides being sour in taste, injures the second crop, which is by far the most valuable. The first crop is gathered green and is sold as an inferior vegetable. The second season commences in January and lasts till the commencement of the monsoon. The first takes about two months to mature. If a tree has fruited too thickly to allow all the fruits to attain good size, the crop is thinned. But this thinning must be done by experienced hands. A full-grown tree, which is 6 to 9

Habitat.—A moderate-sized tree of the sub-Himalayan tract, from the Chenab eastward to Bengal and Burma; ascending to 4,000 feet in altitude.

Gum.—Lac is produced on the tree.

Fibre.—The BARK is used to tie the rafters of native houses. Mr. Campbell says it affords a good strong fibre useful for ropes.

Medicine.—The FRUIT is given in apthous complaints. A bath made from the fruit and BARK is a cure for leprosy (*Rheede*). The juice from the ROOTS is given in bladder complaints, and boiled in milk in visceral obstructions (*Rev. A. Campbell*).

Food.—The FRUIT is eaten and is said to be good, though somewhat insipid. According to Stewart, however, it is not eatable.

Structure of the Wood.—Rough, moderately hard, greyish-brown. Weight 31lb per cubic foot. It is not used economically.

Domestic Uses.—The LEAVES are rough, and are consequently employed in place of sand-paper.

Habitat.—A large evergreen tree, usually epiphytic, throwing down numerous aerial roots from the branches. It occurs in damp forests from the base of the Sikkim Himalaya eastward to Assam and Arracan. There are large Government plantations in Assam, and it is also being cultivated in other provinces. Kurz remarks that it is frequent in Upper Burma, "where whole forests of the species are said to exist in the valley of Hookhoom."

For the cultivation of this and other Caoutchouc-yielding plants, see the account under INDIA-RUBBER.

Gum.—The tree yields the Caoutchouc of Indian commerce.

Structure of the Wood.—White or light brown. Weight 43lb per cubic foot. It is not used.

W. P., III., 33, 248; IV., lxxvii; For. Admn. Rep., Ch. Nagpur, 1885, 633.*

Habitat.—A large tree of the Salt Range and Rajputana along the sub-Himalayan tracts to Bengal, Central and South India, Assam and Burma.

Gum.—In Chanda it is said a gum (*sic*) is obtained from this tree (*Settle. Report*). The *Mysore and Coorg Gazetteer*, referring probably to the same substances, says a gum known as *Chandarasa* is prepared from the milky juice. In both these passages the word *Caoutchouc* should probably be substituted for *gum*.

The lac insect is reported to occasionally frequent the tree. Brandis remarks that it abounds in a milky juice from which bird-lime is prepared.

Dye.—This tree is said to afford a dye (*C. P. Gaz.*, 419). McCann says that the bark, under the name of *goolur*, is mentioned as one of the ingredients used in Lohárdagá in preparing a good black dye.

Medicine.—The LEAVES, BARK, and FRUIT are employed in native medicine. The bark is given as an astringent and a wash for wounds. It is also employed to remove the poison from wounds made by a tiger or cat. The ROOT is useful in dysentery, and a fluid obtained from it by incision is administered as a powerful tonic. Ainslie speaks of this fluid as *attie vnyrtannie*—a powerful tonic when drunk for several days together. The leaves reduced to powder and mixed with honey are given in bilious affections. The small blister-like GALLS common on the leaves, soaked in milk and mixed with honey are given to prevent pitting in small-pox (*Atkinson*). The figs are considered astringent, stomachic and carminative, and are given in menorrhagia and hæmoptysis. The MILKY JUICE is administered in piles and diarrhoea, and in combination with sesamum oil in cancer. The fresh juice of the ripe fruit is used as an adjunct to a metallic preparation which is given in diabetes and other urinary diseases. In the Trichinopoly Manual it is said "a juice is extracted from the trunk which is used by the natives in cases of diabetes." In the Baroda Durbar report of the drugs shown at the Colonial and Indian Exhibition, "the SAP" is said to be used "locally applied to mumps and other inflammatory glandular enlargements." Dr. Dymock also alludes to this application, and adds that it is employed in gonorrhoea in doses of four *tolas*. The Settlement Report of the Chanda district adds that it is used as an application to wounds.

The bark is given to cattle when suffering from rinderpest. It is ground with onions, cummin, and cocoa-nut spathes and mixed with vinegar. (*Coimbatore Dist. Man.*).

Milk.

207

Medicine.—The FRUIT, SEEDS, and BARK are possessed of valuable emetic properties followed by more or less purging. This property was first brought to notice by Dr. Moodeen Sheriff. The acrid MILK obtainable from this species is used medicinally in Kangra. The bark, in doses of from 15 to 30 grains, three or four times daily, is stated to act effectually as an antiperiodic, and in half these quantities as a good tonic (*Pharm. Ind.*). In Bombay and the Concan the powdered fruit heated with water to form a poultice is applied to buboes. It is also given to milch cattle to dry up their milk (*Dr. Dymock*).

SPECIAL OPINIONS.—§ "According to Sanskrit writers the figs of this plant promote the secretion of milk. They are also supposed to preserve the foetus in the womb" (*U. C. Dutt, Civil Medical Officer, Sérampore*). "I have been using the fruit, seeds, and bark of *Ficus hispida* occasionally in my practice ever since I first found them in 1867 to possess the emetic property. They are good emetics, and act efficiently if assisted with warm water and tickling of the throat. The seeds of the ripe fruit should be dried and preserved from moisture in stoppered bottles, reduced to a powder when required, and administered in one-drachm doses. The bark is a stronger emetic, but its action is sometimes attended with more or less purging. Its dose is from forty grains to a drachm. The dose of

Bark.
218

Medicine.—The BARK of this, along with the barks of other four species of Ficus and of Melia Azadarachta, pass by the name of *Panchaval kata* (or the five barks); they are used in combination. A decoction is much employed as a gargle in salivation, as a wash for ulcers, and as an injection in leucorrhœa.

FOOD.
Young shoots.
219

Food and Fodder.—The YOUNG SHOOTS are said to be eaten in curries by the natives. The LEAVES make good elephant and cattle fodder. (*Brandis*).

FODDER.
Leaves.
220

Structure of the Wood.—Grey, moderately hard. Weight about 35lb; not durable. It is used in Assam and Cachar to make charcoal, but according to Roxburgh it is useless even for firewood.

TIMBER.
221

Domestic Uses.—A good avenue tree and planted for ornamental purposes.

DOMESTIC.

Habitat.—A large glabrous usually epiphytic tree, found wild in the sub-Himalayan forests in Bengal and Central India. Extensively cultivated in most provinces of India, though less frequently so in Burma.

Gum.—The bark yields a tenacious milky juice which hardens into a substance resembling Caoutchouc.

"Its stem gives out a resinous gum which is used as sealing-wax, and is also employed by artificers to fill up the cavities of hollow ornaments" (*Gaz. Bomb.*, VII., 37). This same curious fact is alluded to in the Ahmedabad Gazetteer (IV., 24). It is there stated that "The *piplo* (*Ficus religiosa*) and the *bordi* (*Zizyphus Jujuba*) yield a wax much used by goldsmiths for staining ivory red. It may here be pointed out, however, that these trees are the chief source of lac, and that the so-called gum mentioned above may be only the waxy excretion caused by the lac insect, and not a gum at all. The Rev. A. Campbell remarks that the milky sap is known among the Santals as *loré*. Lac is abundantly produced on this tree; indeed, according to many writers, this is its chief use. A bird-lime is prepared from the milky juice, which is in the Deccan called *shelim*.

SPECIAL OPINIONS.—§ "Juice used as a bird-lime. One-fourth seer pipal juice, 2 chittacks linseed oil (castor oil will not do); simmer over fire for five minutes, let cool" (*W. Forsyth, Civil Medical Officer, Dinajpore*; *U. C. Mukerji, M.B., C.M., Civil Medical Officer, Dinajpore*).

Dye and Tan.—The BARK is said to be sometimes used in tanning. Drury mentions that the LEAVES are employed by the Arabs for this purpose. Wardle, however, says it contains little or no tannin, but yields to boiling water a reddish pale-brown colouring substance which by the employment of various processes gives to tasar, mulberry silk, and woollen fabrics, faint reddish fawn colours. The amount of colouring matter in the bark is small, but it might prove a convenient dye where faint shades are required or for modifying the colours produced by other dye-stuffs. McCann wrote that the bark of this tree is also mentioned as being used along with other barks when preparing a permanent black in Bengal. Liotard says the roots, on being boiled in water, produce with alum on cotton cloth a pale pink colour.

sanctum) is ordered. He further remarks that it is the transformation of the gods, *Guru*, and is termed *Ashwath*. It is specially worshipped on every Saturday of the month *Shrávan*, and on every *Somvati*, i.e., on every Monday on which a new moon falls. The Hindu who plants a peepul tree does so expecting that just as he thereby affords shade to his fellow-creatures in this world, so after death he will not be scorched by excessive heat in his journey to the kingdom of Yama (*Oudh Gaz.*, III., 345). There are five sacred trees among the Hindus, viz., *peepul*, *guldár*, *bargad*, *pikar*, and *mango*, but of these the first is by far the most revered. A good Hindu who on a journey sees a peepul tree will take off his shoes and walk five times round the tree from right to left (*pardachna*). While doing so he repeats the verse which may be translated "The roots are Brahma, the bark Vishnu, the branches the Mahadeos. In the bark lives the Ganges, the leaves are the minor deities. Hail to thee, king of trees" (*Elliott, Chronicles of Ornao*).

The peepul is "believed to be inhabited by the sacred triad, Brahma, Vishnu, and Shiv. It is used at the thread investiture and at the laying of the foundation of a building. Vows are made to it and it is worshipped; male offspring is entreated for under its shade, pious women moving round its trunk 108 times. So sacred is it that none will destroy it, even when it grows on the crevices of walls and buildings, pulling down the strongest masonry. Of its wood the spoons are made with which to pour clarified butter on the sacred fire" (*Bomb. Gaz.*, V., 37).

Habitat.—A large evergreen tree, having a few aerial roots: met with at the base of the Eastern Himalaya from Kumaon to Bengal, Assam, South India the Deccan Peninsula, Burma, and the Andaman Islands. Distributed to the Malay Islands, China, and New Caledonia.

The *Flora* describes two varieties of this species:—

α *F. retusa*, Linn.—The *Nandruk* of the Deccan Peninsula.

β *F. nitida*, Thunb.—The tree of the trans-Gangetic regions.

Medicine.—The bark of the root, the root itself, and the leaves boiled in oil form good applications for wounds and bruises (*Rheede*). In rheumatic headaches the leaves and bark pounded are applied as a poultice. In flatulent colic the leaf-juice is used, mixed with that of *tulsi*, and *ghí* (equal parts), applied externally and accompanied by fomentation with a hot brick (*Dymock; Rheede*). The juice of the bark in doses of one tola in milk has a reputation in liver disease.

Structure of the Wood.—Light reddish-grey, close-grained, moderately hard, beautifully mottled. Weight 40lb per cubic foot. It is used

The Peepul Tree.

thus being less suited for avenue and road-side planting than *F. retusa*, which is spoken of as the best of the road-side trees. In Oudh it seems to be specially associated with the *Sál* (*Shorea robusta*). The fruits ripen in May to June.

Gum.—Roxburgh remarks that the milky juice flows abundantly from fresh wounds, and is very tenacious.

Resin.—The lac insect is reared extensively on *F. Rumphii* in Assam. This tree is specially cultivated for that purpose, and is remarkable on account of the insect not destroying it, though crops are taken annually.

Fibre.—According to the Rev. A. Campbell the BARK yields a cordage fibre of good quality.

Medicine.—The Santals use the FRUIT as a drug. Dymock writes of this species: "The JUICE is used in the Concan to kill worms and is given internally with turmeric, pepper and *ghí*, in pills, the size of a pea, for the relief of asthma; it causes vomiting. The juice is also burned in a closed vessel, with the flowers of *umdar*, and *4gunjás* weight of the ashes mixed with honey, is given for the same purpose."

Food and Fodder.—The FRUIT is eaten by the natives. The LEAVES and BRANCHES are used for cattle fodder.

Structure of the Wood.—Very soft, spongy. Weight 27lb per cubic foot. The wood is used in Cachar to make charcoal, and is also employed in tea manufacture and as fuel.

Domestic and Sacred.—The leaves are used in *panch-pallavs*.

(J Murray)		
FISH , Day, <i>Fishes</i> , in <i>Fauna of British India</i>		284
For the purposes of a description, such as the following, the Fish of India may be divided into two great classes—THE MARINE and the FRESH WATER—both of which are not only very large, but owing to their forming an extremely important source of the animal food of the Natives of this country, are well worthy of careful attention. The question of the best means of protecting and stimulating the large fishing industries of India has always attracted much attention, and the natural history of the subject has been the object of careful and laborious research on the part of many learned zoologists. Of all the provinces of India a Fisheries Act exists in Burma alone, but the question of framing an Act to embrace all the provinces is at present under the consideration of Government.

Fishing Classes and Fisheries.

FISH-EATING
CLASSES.

by the people of the country. In considering this question it is, therefore, necessary to observe first of all what proportion of the people of India and Burma can consume fish as food without infringing religious prejudices. In the Panjáb and North-Western Provinces comparatively few of the inhabitants are thus prohibited; the large Muhammadan population eat fish, except those without scales and fins (such as the eel), while the Hindus, with the exception of certain Brahmans, Thakurs, Baniyas and Bhagats, consume fish of all kinds. Similarly, in Hyderabad, Mysore, and Coorg, more than half the population are permitted by their religion to consume fish; in Oudh the majority can do so; and in Sind nearly all except the Brahmans. Varying statements are made regarding Bombay in the District Gazetteers, from three-fourths in Khandesh, to 25 per cent in Bijapur, but the former figure probably represents more nearly the actual average; only Brahmans, high-caste Súdras, Márwár Vanís, Lengáyats, Jains, and a few others being prevented by their castes from eating fish. In Madras about a similar percentage; in Bengal proper from 90 to 95 per cent.; in Assam and Chittagong almost the entire population are permitted to eat fish; while in Burma the use of fish diet is universal, notwithstanding that the Burmans as Buddhists profess the greatest horror at taking the lives of the lower animals. They console their consciences, however, with the idea that the sin lies entirely with the fishermen, and in Burman temples are depicted vivid representations of the terrible tortures the latter will have to endure in a future existence.

Notwithstanding the enormous market for fish, and the teeming waters in and around India, the supply appears to be everywhere insufficient to meet the demand, while the fishing classes are wretchedly poor. Dr. Day, in commenting on this fact, writes: "Investigating how the local markets were supplied with fish up to 1873, the replies from native officials gave the following results. In the Panjáb one in ten markets was sufficiently supplied, in the North-West Provinces one in three, in Oudh one in four. In Bombay the amount was stated to be insufficient in all, and similar reports came from Hyderabad, Mysore, and Coorg. In Madras near the sea the quantity was sufficient, but inland it was only so in one out of ten." In a further passage he writes: "The most casual observer cannot fail to perceive how numerous are the varieties, and vast the number of the finny tribes in the seas of India, but from some cause,—whether due to legislative enactments and local obstructions, or native apathy and impecuniosity,—the harvest has, up to within the last few years, been comparatively untouched, an enormous amount of food still remains uncaptured, while famines are devastating the contiguous shores."

FISHING
CLASSES.
286

Fishing Classes and Fisheries.—The MARINE FISHING CLASSES of India present many features of great interest, showing, as they do, survivals of manners and customs dating from very remote times. According to ancient Hindu legislation they belonged to the Súdra or servile caste. In most places they still maintain that they were, of old, divided into two distinct classes: (1) those who captured fish in the deep sea, (2) those who pursued their avocation from the shore, fishing in back-waters and creeks. Nowadays, however, owing to the depressed condition of the fishing industry, the deep sea fishermen (except where salt is cheap or a good local market exists) have taken to the less expensive occupation of plying their work inshore, and earn part of their living by work of other sorts. In Sind the fishermen are Muhammadans and are termed Mohanis. They are probably partly immigrants from Arabia, and partly Hindus converted to Islam. In Bombay they are chiefly Machhis, Márátha Bhoís, Káche Bhoís, Menjage Bhoís, Bagdi Bhoís, and Kolís, but many other classes occasionally fish. In the Madras Presidency they have

Classification of Fisheries

(F Murray)

FISH.

customs of a patriarchal nature, which are, however, more strictly observed on the Coromandel than on the Western coast. The present organization in those parts is probably the remains of a very ancient system, as it is difficult on any other supposition to account for the immense hereditary power held by certain individuals. Not only have they hereditary and elective headmen of villages, but also hereditary priestly chiefs, who are the final referees in all family and caste disputes. Regarding these fishing tribes Dr. Day writes: "The condition of the sea-fishermen in Sind about ten years ago when investigations were made, showed that they were fairly well off, miserably poor in Bombay except in the vicinity of large towns, in a prosperous condition from South Cánara down the western coast of the Madras Presidency, but once round Cape Comorin they again appeared as a poverty-stricken race of people, and continued so up the Coromandel coast, except when residing near large centres of population."

The FISHERMEN OF FRESH WATERS are, as a rule, members of fish-eating castes, who engage in fishing as an occasional and subsidiary occupation, only a very few of the original fishing castes still restricting their means of livelihood to their hereditary industry. Under native rule in India this was not so; fishing having then been in the hands of distinct castes, but as British rule has given up taxes on the industry, and of recent years fishing rents as well, it is now no one's interest to prevent undue depletion of the fisheries, and as a consequence fishing is no longer generally remunerative.

Classification of Fisheries.—SALT-WATER.—Many and various methods of fishing are employed along the coasts of India and Burma, of which it is impossible, within the scope of the present article, to give a complete account. The chief characteristics of the systems may, however, be

copied from Dr Day's

1st Tidal Fisheries

fish are carried by the ebb. They are then

removed by scoop, lave, cast or other nets, or screens may be constructed of stonework, bamboo, rattan, or reed, to allow of the escape of the water

arrows, and fishing with

all employed in various

parts of the country. 6th, Deep sea Netting—Is, as already stated, married on to a very limited extent only, not only because of the insufficiency of a remunerative market, but also because the necessary appliances, boat, net,

FISH.	Classification of Fisheries.
FISHERIES.	<p>&c., are expensive, and the fisher class is a miserably poor one. For instance, Dr. Day informs us that in <i>Sind</i>, a boat costs about £100, and a net suitable for deep-sea fishing involves an outlay of from £40 to £50. The purchase of such an expensive plant, therefore, necessitates the borrowing of the money, on which the fisherman has to pay an exorbitant interest, leaving but a poor margin of profit as the reward of his labour.</p>
FRESH-WATER, 289	<p>FRESH-WATER.—With the establishment of British rule the fishing on rivers, which at one time was restricted either by the imposition of taxes or by leasing out to contractors the monopoly of fishing, has become, in most parts of the country, free and unrestricted. The natural result has been that every fish consumer is at liberty to capture his own fish, and the old fresh-water industry has necessarily declined. But an evil outcome of this has been that every endeavour is now made to catch as many fish, of all sorts and sizes, as quickly and cheaply as possible, and for this purpose all kinds of appliances are used. Rivers are dragged with nets having infinitesimally small meshes, or with coarse cloths; or a similar apparatus is even placed across a stream from bank to bank, and another dragged down stream to it, thus clearing every living thing out of the tract netted. At the same time the agricultural classes catch fish for themselves by means of wicker traps, baskets, and nets. Neither breeding fish nor fry are respected, everything caught is killed and eaten or destroyed, and no close season anywhere exists; hence as a natural result the supply of fish is everywhere diminishing. This is especially so in the case of the finer migratory hill fishes, such as the <i>mahasir</i>. Owing to the immense number of wicker-work and net weirs now to be found in most mountain streams at every few miles, the water is literally strained, with the inevitable consequence that the fish are rapidly decreasing in the lower reaches. In some places, more especially in the Doon hill tracts, streams are also frequently diverted in part of their course by damming them up, the large fish are extracted from the pools in the old bed of the river, and the fry are left to die as the water dries up. Not only are these and many other of the poaching practices so strongly condemned in England carried on day after day, but poisoning the water is also frequently resorted to as a means of ready and wholesale destruction. The principal plants employed for this purpose are:—<i>Strychnos Nux-vomica</i>, <i>Lasiosiphon speciosus</i>, <i>Balanitis Roxburghii</i>, <i>Tephrosea suberosa</i>, <i>Euphorbia Tirucalli</i>, <i>Hydrocarpus Wightiana</i>, <i>H. venenata</i>. Of recent years, also, a still more powerful agent of destruction has been found in dynamite, to the use of which natives employed in mines, and on tea, coffee, and cinchona estates have become habituated. They find no difficulty in possessing themselves of their employers' cartridges on off-days, and employ them freely, with the result that the place dynamited is denuded of all fish life, full grown, fry and ova. Besides these methods of directly killing fish, there are many other artificial agencies which indirectly, but to a very great degree, affect fisheries in many districts. Perhaps the most important of these is the large irrigation works now existing in many parts of the country, formed by diverting a large amount of the water of a river down a canal. Where these canals are not constructed for navigation as well as irrigation, falls frequently exist, down which the fish can pass, but cannot return. The canal is thus converted into a vast fish-trap, wherein all the fish are destroyed when run dry to examine it for necessary repairs. In the same way the small tributary irrigation canals act as traps from the main channel, all the fish entering them being invariably killed. The yearly inundations attendant on the rains, and the annual drying up of many tanks, must also be fertile sources of mortality. Dr. Day, in summing up the consideration of this subject in his admirable report,</p>
Contrivances, 290	
Poisons. 291	
Explosives. 292	

Curing of Fish.

(J. Murray)

FISH.

writes: "Thus it has come to pass that among the animal productions of India, fresh-water fish meet with the least sympathy, and the greatest persecution, many forms having to struggle for bare existence, in rivers which periodically diminish to small streams, or even become a mere succession of pools, or in tanks from which the water totally disappears. They have their enemies in the egg stage, in their youth, and during their maturity, but among these man is their greatest foe, as any one who desires a fish diet captures these creatures, whenever and wherever he gets the chance, irrespective of season, age, and size. In certain districts they simply appear to exist solely because man and vermin have been unable to destroy them."

Many suggestions have at different times been made to remedy this wholesale and indiscriminate destruction, by such means as preventing poisoning, regulating the size of net mesh, guarding the mouths of irrigation canals against the entrance of fish, levying taxes on the use of fishing implements, &c. As above stated these are at present under the consideration of Government, with a view to the introduction of a Fisheries Bill.

Rent of Fisheries.—The available amount of information regarding

FISHERIES.

Rent.
293

percentage rent to have been '17 on the value of the property farmed. The revenue derived from Sind Fresh-water Fisheries in 1882-83 was Rs2,541, and from Burma in 1883, 12 to 13 lakhs of rupees—a not uninteresting evidence in favour of a Fisheries Act for the other provinces of India.

Salt and Dead Fish. It is suggested that a tax be levied on salt and dead fish.

F. 297

FISH.	Industrial Products from Fish.
TRADE IN CURED FISH.	<p>the five years ending 1887-88 the total average imports were 12,088,846lb, valued at R10,82,836. In comparison with the five years ending 1882-83, this shews a considerable increase, the average for that period having been 8,921,583lb, value R7,85,557. Not only is there an increase in imports but a larger proportion of the fish thus obtained is consumed in the country, the re-exports shewing a decrease from an average of 444,447lb in the five years ending 1882-83 to 176,361lb in the later period. The countries which form the chief sources of supply are Mekran and Sonmiani, the Straits Settlements, Arabia, Persia, Ceylon, and Turkey in Asia. The exports appear to have remained very steady during the past ten years, though fluctuating considerably year by year. Thus in the latter half of that period the total average quantity was 4,096,074lb, value R3,55,756, while in the former it was 3,393,634lb, value R1,82,857. The port from which much the largest proportion was exported last year was Madras, which shipped 4,560,858 out of a total of 4,870,944lb, while Ceylon formed the principal market, importing 4,384,034lb of the whole. It would be interesting to know to what extent the enlightened efforts to supply cheap salt had influenced the formation of the large Madras export trade as compared to any other province.</p>
FISH OIL. 298	<p>Fish Oil.—The manufacture of oil from fish is carried on all along the Western coast of India and also in other parts. It is obtained chiefly from the livers of sharks, skates, saw-fishes, cat-fishes, oil sardines, and other kinds, also from the heads, intestines, and even the whole body of some species. The process of manufacture as carried out in India is very crude; the livers are not washed, but fresh or putrid, clean or foul, they are put into a pot and heated up to boiling point, when the oil separates, floats on the top, and is skimmed off. It undergoes no straining and is consequently impure, and frequently rancid. At Rangoon a large amount is manufactured, the average quantity being said to exceed 77 tons a month. The ordinary oil thus obtained is employed for the purposes of cooking, lighting, and in tanning leather, while that extracted from the livers of species of <i>Carcharias</i> or shark is said to be an efficient substitute in medicine for cod-liver oil. Fish oil is a commercial article of considerable importance, large quantities being exported to Europe. In the official trade returns, however, no separate statistics exist, so that definite information as to its extent cannot be furnished.</p>
FISH ROES. 299	<p>Fish Roes.—Obtained from several species, are largely employed as an article of food in many parts of India, and are sold in nearly every bazar of South and East Asia.</p>
FISH SKIN. 300	<p>Fish Skin.—The rough skins of species of Sharks, Skates, and Rays are employed for polishing in several parts of the country. Shagreen or shark's skin is chiefly used to cover scabbards.</p>
FISH MAWS. 301	<p>Fish Maws.—Along with sharks' fins form an important article of foreign trade. See SHARKS' FINS, FISH MAWS, &c., in another volume.</p>
FISH SCALES. 302	<p>Fish Scales.—The scales of the Mahasir (<i>Barbus tor</i>) are employed in the manufacture of playing-cards. The scales are cut in a circular form about 1½ inch in diameter, and painted as required. The principal seat of their manufacture is at Shahabad in Bengal.</p>
MEDICINE. 303	<p>Medicine.—Generally speaking, fish diet is considered by Hindu writers to be less heating than animal flesh, less likely to excite an inordinate flow of bile, more easily digested, and to be particularly indicated in cases of diabetes. Certain forms of dried fish are also held to be powerfully aphrodisiac, and in Patna, Dr. Irvine informs us, a concretion from the head of a fish called "<i>Sung-sir-mahi</i>" is supposed to have the same property. The oil of the liver of the <i>Gadus morrhua</i>, or common Cod, has well-known properties as a nutritive tonic and alterative, and, as already mentioned, it</p>

FISH.

Indian Fishes

- 405 *Chrysophrys berda*; *Day, Fish. Ind., 140; Fau. Br. Ind., II., 44.*
 BLACK ROCK-FISH of Europeans in Malabar.
 Vern.—*Kala madwan*, HIND.; *Dun-de-a, jaras*, SIND.; *Currie, currapu-mattawa*, TAM.; *Kalamara*, TEL.; *Ari*, MALAY; *Má-rú-ki-dah*, ANDAMAN.
 Habitat.—The seas of India to the Malay Archipelago and beyond. This fish is excellent eating, greatly excelling the other species, and is common in Malabar until July.
- 406 *C. sarba*; *Day, Fish. Ind., 142; Fau. Br. Ind., II., 47.*
 Vern.—*Suffada-maddawa*, HIND.; *Vellamattawa*, TAM.; *Chitchilli*, TEL.; *Tin-til*, BELUCH.
 Habitat.—The seas of India, especially abundant on the Madras coast. As food it is inferior to the *berda*.
- 407 *Cirrhhina cirrhosa*; *Day, Fish. Ind., 547; Fau. Br. Ind., I., 277.*
 Vern.—*Ven-kánda*, TAM.; *Arusu*, TEL.
 Habitat.—Godavery, Kistna, and Cauvery rivers, and generally in Southern India. A very active fish, fair eating, but bony.
- 408 *C. fulungee*; *Day, Fish. Ind., 549; Fau. Br. Ind., I., 280.*
 Vern.—*Fulungi*, MAR.
 Habitat.—Rivers of Poona and the Deccan.
- 409 *C. latia*; *Day, Fish. Ind., 548; Fau. Br. Ind., I., 279.*
 Vern.—*Kala-batta*, BENG.; *Behrah, tellarri*, PB.; *Curru*, SIND.; *Wattunah*, MAR.
 Habitat.—The rivers of Bengal, Orissa, the North-West Provinces, the Panjáb, Sind, the Deccan, and along the Himálaya.
- 410 *C. mrigala*; *Day, Fish. Ind., 547; Fau. Br. Ind., I., 278.*
 Vern.—*Mrigala, naim*, HIND.; *Rewah*, BENG.; *Mrigale, mirrgah*, URIYA; *Mor-ah-ki*, SIND; *Nga-kyin, nga-gyein*, BURM.; *Mirgal, mrigala*, SANS.
 Habitat.—The rivers and tanks of Bengal, the North-West Provinces, the Panjáb, Sind, Kutch, the Deccan, and Burma. An excellent fish for stocking tanks.
- 411 *C. reba*; *Day, Fish. Ind., 549; Fau. Br. Ind., I., 279.*
 Vern.—*Rewah*, HIND.; *Batta*, BENG.; *Chetchua-porah*, URIYA; *Sunni*, PB. and SIND; *Pil-aringan*, TAM.; *Ilemose, chittahri, pullarasu*, TEL.; *Lassim*, ASSAM; *Boggut, kólis*, MAR.
 Habitat.—Rivers throughout India.
- 412 *Clarias magur*; *Day, Fish. Ind., 485; Fau. Br. Ind., I., 115.*
 Vern.—*Magúr, mah-gur*, BENG.; *Mangri*, PATNA and MONGHIR; *Magurah*, URIYA; *Kug-ga*, PB.; *Yerri-vale*, TAM.; *Marpú*, VIZAG.; *Nga-khú*, BURM. and MUGH.
 Habitat.—Fresh and brackish waters of the plains of India, Burma, Ceylon, and the Malay Archipelago. As food this fish is deemed highly nourishing, and is extensively salted in Burma.
- 413 *Clupea fimbriata*; *Day, Fish. Ind., 637; Fau. Br. Ind., I., 273.*
 SARDINE, of Europeans in India.
 Vern.—*Charri-addi*, HIND.; *Kich-uk-lonar*, SIND; *Pánduringa*, TAM.; *Cuttay-charlay*, MALAY.
 Habitat.—Red Sea and the seas of India. Employed extensively as food and also in the preparation of fish-oil. All the members of this genus are much captured for food by the Natives, and some are considered delicious by Europeans.
- 414 *C. ilisha*; *Day, Fish. Ind., 640; Fau. Br. Ind. I., 276.*
 THE SABLE or SHAD FISH; HILSA.

of Economic Value

(F Murray)

FISH

- Vern**—*Hilsa*, *thsha* BENG, *Ruri* of the Ganges, *Dumra* of the Indus
Pulla SIND, *Ulam*, *LAM*, *Pulasa*, *pulasa* or *palasah*, TEL, *Olam*
min MADRAS, *Nga tha louk*, BURM *Ikan truboh* MALAYS
- Habitat**—Persian Gulf and coasts of India and Burma, passing up the large rivers to breed
- These fish are excellent as food until they have deposited their ova, when they become thin and positively unwholesome. Their flavour has been compared to a combination of that of the salmon and herring, but though highly esteemed for the table, they are rather rich and difficult of digestion
- Clupea longiceps**, Day, *Fish Ind*, 637, *Fau Br Ind*, I, 373 415
- THE MALABAR OIL SARDINE**
- Vern**—*Mutthi*, *charlay*, *karlay*, MAL, *Mutthi* KAN, *Lonar* SIND, *Ligur* BELUCH
- Habitat**—Sind and the Western coast of India more rarely found on the Eastern, Ceylon, and Andaman coasts. Large quantities of oil are made from this species in Malabar
- C. variegata**, Day, *Fish Ind*, 639, *Fau Br Ind*, I, 375 416
- Vern**—*Nga la-bi* BURM
- Habitat**—The Irrawaddi and its branches
- Coilia ramcarati**, Day, *Fish Ind*, 631, *Fau Br Ind*, I, 396 417
- Vern**—*Uralli* URIYA
- Habitat**—The rivers and estuaries of Bengal
- Corica soborna**, Day, *Fish Ind*, 642, *Fau Br Ind*, I, 378 418
- Vern**—*Cut wdi urai* god has URIYA
- Habitat**—The rivers of Bengal and Orissa
- Cybinus commersoni**, Day, *Fish Ind*, 255, *Fau Br Ind*, II, 211 419
- THE SEER OF SEIR FISH**
- Vern**—*Konam*, *mah-wu-laachi*, *ah ku-lah*, TAM, *Chambam* MALAY, *Ikan tanggiri* MALAYS
- Habitat**—Seas of India. The species of this genus when of the proper size, are considered amongst the most delicate of all marine fishes. If under a foot in length they are dry, from 1½ to 2½ feet they are most excellent, while above this they become coarse
- C. guttatum**, Day, *Fish Ind*, 255, *Fau Br Ind*, II, 210. 420
- THE SEER OF SEIR FISH**
- Vern**—*Wingeram* VIZAG, *Arrakiah* MALABAR
- Habitat**—The seas of India. Good eating, especially if cooked when quite fresh, salts well
- C. lineolatum**, Day, *Fish Ind*, 256, *Fau Br Ind*, II, 212 421
- THE SEER OF SEIR FISH**
- Vern**—*Barim kutti* MALAY, *Tanggiri*, MALAYS
- Habitat**—Seas of India
- Cynoglossus lingua**, Day, *Fish Ind*, 433, *Fau Br Ind*, II, 445 422
- SOLE**, of Europeans in India
- Vern**—*...*
- Fau Br Ind*, I, 356 423
- Behar, and the Himalaya, at Darab. The prettily-marked fish con-

FISH.	Indian Fishes
	stituting this genus, which are nearly allied to the Tench, are considerably used as food.

of Economic Value.

(J. Murray)

FISH

Habitat—Seas and estuaries of India, most common at Bombay, but decreasing in numbers down the Malabar coast. This fish is highly esteemed as food, whether fresh or salted, in the latter form it is extensively employed as a relish with curries, and is known as "Bombay duck."

Hemurhamphus buffonis; Day, Fish Ind., 516. Fau. Br. Ind., I., 427.

459

Vern—*Ku-dá-rock-o-dah*, ANDAMANS

Habitat—The seas and tidal rivers of Bombay, Bengal, and the Andamans. The roes of the fishes of this genus are collected largely on the Malabar coast of India, where they are esteemed a great delicacy.

H. cantoni; Day, Fish Ind., 514. Fau. Br. Ind., I., 423.

460

THE GUARD FISH of the Straits Settlements

Vern—*Toda-pendek*, MALAY

Habitat—Bombay, Malabar, Madras, and the seas of India

H. cantoni; Day, Fish Ind., 514. Fau. Br. Ind., I., 423.

461

H. reynaldi; Day, Fish Ind., 515. Fau. Br. Ind., I., 425

462

Vern—*Morrul*, MALAY

Habitat—The seas of India (Day) Malabar and the tanks around Calcutta (Watson).

H. cantoni; Day, Fish Ind., 514. Fau. Br. Ind., I., 423.

463

augusi, morala, BENG.; *Lassum*,

issa, Assam, and Burma. The

below, are employed as food by the Natives. Some, such as the *KORU*, are also highly esteemed by Europeans.

L. ariza; Day, Fish Ind., 544. Fau. Br. Ind., I., 272

464

Vern—*Ariza*, BENG.; *Coal*, TAM.; *Nga lu*, BURM.

Habitat—The Wynad and Bowany rivers at the foot of the Nilgiri hills, also the Cauvery river.

L. boga; Day, Fish Ind., 543. Fau. Br. Ind., I., 269.

465

Vern—*Bangum batta, boga*, BENG.; *Kala battali*, URIYA; *Arisea*, TEL.; *Kinda-min, coal-arinsa-candi*, TAM.; *Kyout-nya lu*, BURM.

Habitat—The rivers and tanks of the Gangetic Provinces, Madras, and Burma.

L. calbar; Day, Fish Ind., 543. Fau. Br. Ind., I., 269.

466

Vern—

nga ong tong, BURM.

Habitat—The fresh waters of the Panjab, Sind, Cutch, the Deccan, Southern India, and Malabar, and from the Kistna through Orissa, Bengal, and Burma.

L. calbar; Day, Fish Ind., 543. Fau. Br. Ind., I., 269.

467

Kul ka batta, BENG.; *Ind. gualca*,

1 Himalaya, also a native of the

Brahmaputra in Assam.

L. dussumieri; Day, Fish Ind., 538. Fau. Br. Ind., I., 262

468

Vern—*Tall*, MALAY

Habitat—Rivers of South Malabar, Ceylon, and peninsular Hindia.

F. 222

FISH.	Indian Fishes
469	<p><i>Labeo fimbriatus</i>; Day, <i>Fish. Ind.</i>, 536; <i>Fau. Br. Ind.</i>, I., 258. Vern.—<i>Bahrum</i>, URIYA; <i>Vencandi</i>, shaal, TAM.; <i>Ruchu</i>, <i>gandu-mennu</i>, TEL.; <i>Bobri</i>, MAR. Habitat.—The rivers of the Panjáb, Sind, and the Deccan, also of South-ern India, at least as far as Orissa. It is a fairly large fish, attaining a length of 1½ feet, and though bony, is good eating.</p>
470	<p><i>L. gonius</i>; Day, <i>Fish. Ind.</i>, 537; <i>Fau. Br. Ind.</i>, I., 261. Vern.—<i>Cursa</i>, <i>collúse</i>, HIND.; <i>Kurchi</i>, <i>kursi</i>, <i>goni</i>, BENG.; <i>Cursua</i>, URIYA; <i>Couric</i>, <i>bahtur</i>, ASSAM; <i>Mosúl</i>, TEL.; <i>Cir-re-oh</i>, SIND; <i>Nga-pay</i>, <i>nga-dane</i>, <i>nga-hú</i>, BURM. Habitat.—The Indus in Sind, through the North-Western Provinces, Bengal, and Orissa, to Ganjam, as low as the Kistna; also Assam and Burma. It is a large fish attaining the length of 5 feet, and is much used for stocking tanks.</p>
471	<p><i>L. kontius</i>; Day, <i>Fish. Ind.</i>, 539; <i>Fau. Br. Ind.</i>, I., 264. Vern.—<i>Carramanni</i>, <i>carú-múli-candi</i>, TAM. Habitat.—The rivers along the base of the Nilghiris, and the Cau-very and Coleroon in all their branches down to the coast.</p>
472	<p><i>L. nandina</i>; Day, <i>Fish. Ind.</i>, 535; <i>Fau. Br. Ind.</i>, I., 258. Vern.—<i>Nandin</i>, BENG.; <i>Nga-ohu-don</i>, <i>nga-ne-pyah</i>, <i>nga-yin-pounsa</i>, BURM. Habitat.—The fresh waters of Bengal, Assam, and Burma.</p>
473	<p><i>L. pangusia</i>; Day, <i>Fish. Ind.</i>, 541; <i>Fau. Br. Ind.</i>, I., 266. Vern.—<i>Loanni</i>, <i>pengusiya</i>, BENG. Habitat.—Rivers and tanks of the Himaláya; found also generally throughout Sind, the Deccan and the North-West Provinces, Bengal, Cachar, and Assam.</p>
474	<p><i>L. rohita</i>; Day, <i>Fish. Ind.</i>, 538; <i>Fau. Br. Ind.</i>, I., 262. THE ROHO, or ROHÚ. Vern.—<i>Ruí</i>, <i>rowi</i>, <i>rohita</i>, <i>ruí-mutchli</i>, BENG.; <i>Ruhu</i>, URIYA; <i>Rui</i>, ASSAM; <i>Nga-myiit-chin</i>, <i>nga-myiit-tsan-ni</i>, BURM. Habitat.—Fresh-waters of Sind, and from the Panjáb through India and Assam to Burma. A large fish of 3 feet or more in length, esteemed excellent as food, and propagated with care in ponds in Bengal. Yields oil, for which it is principally employed in the North-West Provinces. U. O. Dutt remarks that the bile of this species is employed in medicine by the Hindús.</p>
475	<p><i>Lactarius delicatulus</i>; Day, <i>Fish. Ind.</i>, 245; <i>Fau. Br. Ind.</i>, II., 196. Vern.—<i>Sudumu</i>, TELUGU; <i>Purruwah</i>, MALAY.; <i>Chundawah</i>, VIZAG. Habitat.—Seas of India. It is insipid, but is eaten, either fresh or salted, by the Natives.</p>
476	<p><i>Lates calcarifer</i>; Day, <i>Fish. Ind.</i>, 7; <i>Fau. Br. Ind.</i>, I., 440. COCK-UP, <i>Calcutta</i>; NAIR FISH, <i>Malabar</i>. Vern.—<i>Begti</i>, <i>bhekti</i>, BENG.; <i>Durruah</i>, <i>bekkut</i>, URIYA; <i>Dangara</i>, SIND; <i>Painni-min</i>, <i>koduwa</i>, <i>karona</i>, TAM.; <i>Pandu kopah</i>, <i>pandu-mennu</i>, TEL.; <i>Niddi-min</i>, <i>nair-min</i>, MALAY.; <i>Padúmenú</i>, VIZAG.; <i>Kuduwa</i>, MADRAS; <i>Nga-tha-dyk</i>, ARRAC.; <i>Koral baor</i>, CHITTAGONG; <i>Todah</i>, AND.; <i>Kakadit</i>, BURM.; <i>Ikan siyakup</i>, MALAYS. Habitat.—Seas, back-waters, and mouths of tidal rivers. This fish is excellent eating, when obtained from the vicinity of large rivers. It salts well, and from it some of the best "Tamarind fish" is prepared.</p>
477	<p><i>Lepidocephalichthys guntea</i>; Day, <i>Fish. Ind.</i>, 609; <i>Fau. Br. Ind.</i>, I., 220. Vern.—<i>Gúnteah</i>, <i>gúteah</i>, <i>bilgagora</i>, BENG.; <i>Kondaturi</i>, <i>gupkari</i>, <i>jubbi-cowri</i>, URIYA; <i>Nga-tha-ley-doh</i>, BURM.</p>

FISH.	Indian Fishes
489	<i>Macrones leucophasis</i> ; <i>Day, Fish. Ind., 449; Fau. Br. Ind., I., 158.</i> Vern.— <i>Nga-pet-lek, nga-nouk-thawa</i> , BURM. Habitat.—Rivers of Burma.
490	<i>M. malabaricus</i> ; <i>Day, Fish. Ind., 450; Fau. Br. Ind., I., 160.</i> Vern.— <i>Cutti min</i> , TAM. Habitat.—Malabar, coast of India, and the Wynaad, extending inland to the ghâts in South Cánara.
491	<i>M. punctatus</i> ; <i>Day, Fish. Ind., 445; Fau. Br. Ind., I., 153.</i> Vern.— <i>Sholang kellelé, psetta-kellelé</i> , TAM. Habitat.—The Bowany river at the base of the Nilghiris.
492	<i>M. tengara</i> ; <i>Day, Fish. Ind., 447; Fau. Br. Ind., I., 156.</i> Vern.— <i>Kuttahrah</i> , HIND.; <i>Tengara, tengrah</i> , BENG.; <i>Bikuntia</i> , URIYA; <i>Ting-ga-rah</i> , ASSAM; <i>Karaal, ting-ga-rah</i> , PB.; <i>Saku-jella</i> , TEL.; <i>Nga-sin-sine</i> , BURM. Habitat.—Northern India, the Panjáb, and Assam.
493	<i>Mastacembelus armatus</i> ; <i>Day, Fish. Ind., 340; Fau. Br. Ind., II., 334.</i> THE SPINED EEL, OR THORNY-BACKED EEL. Vern.— <i>Barua</i> , HIND.; <i>Bahm, bummi, gouti</i> , BENG.; <i>URIYA; Bahm, kahm, gro-age</i> , PB. and SIND; <i>Kul-aral, sha-ta-rah</i> , TAM.; <i>Mudi-bom-mi-day</i> , TEL.; <i>Nga-maway-doh-nga</i> , BURM. Habitat.—From Sind, throughout the fresh and brackish waters of the plains and hills of India, Ceylon, and Burma. It attains 2 feet or more in length, and is good eating, especially when curried, or fried.
494	<i>M. pancalus</i> ; <i>Day, Fish. Ind., 340; Fau. Br. Ind., II., 333.</i> THE SMALL SPINED EEL. Vern.— <i>Ju-gar</i> , HIND.; <i>Turi, bahru</i> , URIYA; <i>Tu-rah</i> , ASSAM; <i>Par-pa-raal</i> , TEL.; <i>Chen-da-la, gürchi, gro-age</i> , PB. Habitat.—Deltas of large rivers of India, and localities near the sea. Good eating, whether fresh or salted.
495	<i>Megalops cyprinoides</i> ; <i>Day, Fish. Ind., 650; Fau. Br. Ind., I., 402.</i> Vern.— <i>Punnikañ, naharn</i> , URIYA; <i>Moran cundai</i> , TAM.; <i>Cunnay</i> , MALAY; <i>Kundinga</i> , VIZAG.; <i>O-pul-dah</i> , AND.; <i>Nga-tan-youet</i> , BURM. Habitat.—Fresh waters and estuaries of India and Ceylon. It is occasionally captured in rivers, but much more frequently in tanks.
496	<i>Mugil corsula</i> ; <i>Day, Fish. Ind., 354; Fau. Br. Ind., II., 349.</i> THE MULLET. Vern.— <i>Undala</i> , HIND.; <i>Corsula, in-ge-lí</i> , BENG.; <i>Kakunda</i> , URIYA; <i>Hurd-wah-re</i> , PB.; <i>Nga-sen</i> , BURM. Habitat.—Rivers and estuaries of Bengal and Burma, extending far above tidal influence in the fresh water. It attains 1½ foot in length and is considered excellent eating. Ainslie remarks regarding this genus: "they are the most excellent fish in India, but are perhaps a little too fat and rich for those who are delicate. They are used both in the fresh and salted state and are much prized by the natives. The spawn salted and dried forms a kind of <i>caviar</i> , called by the Italians <i>boborágo</i> " (<i>Mat. Ind., I., 227</i>). The same objection to its use, however, exists as with the OPHIOCEPHALIDÆ, certain classes refusing to eat the mullet, owing to the resemblance of its head to that of a serpent.
497	<i>M. kunnesius</i> ; <i>Day, Fish. Ind., 349; Fau. Br. Ind., II., 342.</i> THE MULLET. Vern.— <i>Mahlah</i> , MALAY; <i>Cunnesi</i> , VIZAG.; <i>Sada-parauda</i> , MADRAS. Habitat.—Seas of India.
498	<i>M. hamiltonii</i> ; <i>Day, Fish. Ind., 354; Fau. Br. Ind., II., 349.</i> THE MULLET. Habitat.—Rivers of Burma.

of Economic Value	(J. Murray)	FISH
<i>Mugil oculor</i> , Day, Fish Ind., 353. Fau Br Ind., II, 384 MULLET Vern.—Kola-kende, mahlah MALAY Habitat.—Seas of India and China. The season for capturing these fish along the western coast commences about the middle of November, when they swarm close inshore in order to enter estuaries and the mouths of large rivers to deposit their ova, and extends to about February. The roes are collected and dried in the sun, with or without the use of salt.		499
<i>M. parsia</i> , Day, Fish Ind., 350. Fau Br Ind., II, 344 MULLET Vern.—Tarni, BENG., Pan kende paranda MADRAS Habitat.—Seas and estuaries of India. It attains at least 1½ feet in length and is commonly captured for food in the Hooghly at Calcutta.		500

Septis isoppitay, TEL., Mutakri, MALAY Habitat.—Fresh and brackish waters of India and Burma, common in ditches and inundated fields.		508

FISH.	Indian Fishes
509	<p><i>Nemacheilus zonatus</i>; Day, <i>Fish, Ind.</i>, 618; <i>Fau. Br. Ind.</i>, I., 233. Vern.—<i>Mugah</i>, BENG. Habitat.—Throughout the Jumna and Ganges and their affluents, Bhrbhūm, Assam, and Orissa.</p>
510	<p><i>Notopterus chitala</i>; Day, <i>Fish, Ind.</i>, 654; <i>Fau. Br. Ind.</i>, I., 407. Vern.—<i>Chitala</i>, <i>chitol</i>, BENG.; <i>Chitul</i>, URIYA; <i>Sit-tul</i>, ASSAM; <i>Gundun</i>, SIND. Habitat.—A large fish attaining 4 feet or more in length, found in the fresh waters of Sind, Lower Bengal, Orissa, Assam, Burma, and Siam. Hamilton-Buchanan writes: "The belly is uncommonly rich and well flavoured, but the back contains numerous small bones, and a strong prejudice exists against using this fish as food, owing to its being supposed to live on human carcases.</p>
511	<p><i>N. kapirot</i>; Day, <i>Fish, Ind.</i>, 653; <i>Fau. Br. Ind.</i>, I., 406. Vern.—<i>Moh</i>, HIND; <i>Pholoe</i>, BENG.; <i>Pulli</i>, URIYA; <i>Ambutan-wahlah</i>, <i>chota wahlah</i>, TAM.; <i>Kau-dū-li</i>, ASSAM; <i>Moh</i>, but, <i>purri</i>, PB.; <i>Nallak-tallah</i>, MYSORE; <i>Nga-hpoh</i>, <i>nga-phe</i>, BURM. Habitat.—Fresh and brackish waters of India. It grows to 2 feet or more in length and is salted in Burma.</p>
512	<p><i>Ophichthys boro</i>; Day, <i>Fish, Ind.</i>, 664; <i>Fau. Br. Ind.</i>, I., 94. Vern.—<i>Boro</i>, <i>harancha</i>, <i>hijala</i>, BENG. Habitat.—Seas and estuaries of India. The natives in some parts of Bengal imagine that this fish proceeds from the ear of a porpoise.</p>
513	<p><i>Ophiocephalus barca</i>; Day, <i>Fish, Ind.</i>, 365; <i>Fau. Br. Ind.</i>, II., 361. THE WALKING FISH. Vern.—<i>Barca</i>, BENG.; <i>Bora-chang</i>, BUTAN. Habitat.—Large rivers of the Bengal Presidency. All the fish of this genus have hollow cavities in their heads, an amphibious system of respiration, are able to exist for a lengthened period out of water, and can travel some distance over the ground, especially where it is damp. They are all useful as food, and the possibility of carrying them in moist vessels for a long distance renders them extremely valuable. Some classes of natives, however, object to them on account of the resemblance of their heads to those of serpents.</p>
514	<p><i>O. gachua</i>; Day, <i>Fish, Ind.</i>, 367; <i>Fau. Br. Ind.</i>, II., 364. THE WALKING FISH. Vern.—<i>Dheri dhok</i>, HIND.; <i>Chenga</i>, <i>chayung</i>, URIYA; <i>Chen-gah</i>, ASSAM; <i>Donrrah</i>, PB.; <i>Para korava</i>, <i>munru</i>, TAM.; <i>Karavu</i>, MALAY.; <i>Mah korava</i>, KAN.; <i>Korah-mottah</i>, VIZAG.; <i>Chad-dah</i>, AND. Habitat.—Fresh waters, throughout India, Ceylon, Burma, and the Andamans. Described by Thomas as an excellent live bait.</p>
515	<p><i>O. marulius</i>; Day, <i>Fish, Ind.</i>, 363; <i>Fau. Br. Ind.</i>, II., 360. THE WALKING FISH, or MURREL. Vern.—<i>Pu murl</i>, HIND.; <i>Sāl</i>, URIYA; <i>Ha-al</i>, ASSAM; <i>Kubrah sāl</i>, <i>daulah</i>, PB.; <i>Pu verarl</i>, TAM.; <i>Pula chapa</i>, TEL.; <i>Choari verarl</i>, <i>curavu</i>, MALAY.; <i>Huvina murl</i>, KAN.; <i>Murrul</i>, MAR.; <i>Sowarah</i>, VIZAG.; <i>Nga-yan-dyne</i>, BURM.</p>
516	<p>Habitat.—Fresh waters (principally rivers), from Ceylon and India to China. This fish is described by Thomas as affording excellent sport either with live bait or fly. It is one of the best of the OPHIOCEPHALIDÆ as a food fish, and is excellent for stocking tanks. <i>O. punctatus</i>; Day, <i>Fish, Ind.</i>, 367; <i>Fau. Br. Ind.</i>, II., 364. THE BLACK CABOOSE. Vern.—<i>Phul dhok</i>, HIND.; <i>Gorissa</i>, <i>gurrie</i>, <i>cartua-gorai</i>, URIYA and ASSAM; <i>Dullūnga</i>, PB.; <i>Dhoalt</i>, SIND.; <i>Korava</i>, <i>para-kora wa</i>, TAM.; <i>Muttah</i>, TEL.; <i>Beli-korava</i>, KAN.; <i>Nga-win</i>, MUGH.</p>

 Vern.—*Tilri*, MAR.; *Salava-jella*, TEL.; *Nga-zin-sap, nga-myin*, BURM.
 Habitat.—The fresh waters of Puna, the Deccan, and the rivers Kistna and Jumna. This fish attains upwards of a foot in length, and is one of the best of the genus as a food.
- 551 *Pseudorhombus arsius*; Day, *Fish. Ind.*, 423; *Fau. Br. Ind.*, II., 441.
 Vern.—*Itan-siblah*, MALAYS; *Ky-tha-thong-dah*, ANDAMANS.
 Habitat.—Through the seas and estuaries of India. Used as food.
- 552 *Psilorhynchus balitora*; Day, *Fish. Ind.*, 527; *Fau. Br. Ind.*, I., 244.
 Vern.—*Balitera*, BENG.
 Habitat.—Hill streams and rapids in North-east Bengal and Assam. Employed as food by Natives.
- 553 *Pseudoscarus rivulatus*; Day, *Fish. Ind.*, 413; *Fau. Br. Ind.*, II., 426.
 Vern.—*Ar-dah*, ANDAMANS.
 Habitat.—Seas of India. Eaten by Natives of some parts of the coast.
- 554 *Pterois volitans*; Day, *Fish. Ind.*, 154; *Fau. Br. Ind.*, II., 62.
 Vern.—*Parrüah*, MALAY; *Kodifungi*, VIZAG.; *Chib-ta-ta-dah*, AND.
 Habitat.—Throughout the seas of India. Employed as food in some parts of the country.
- 555 *Pteroplatea micrura*; Day, *Fish. Ind.*, 741; *Fau. Br. Ind.*, I., 56.
 Vern.—*Perüm tiriki*, TAM.; *Tappu cüti*, TEL.; *Tenki-kunsul*, VIZAG.; *Lek kyauk temengnee*, BURM.
 Habitat.—The seas of India. Used as food.
- 556 *Raconda russelliana*; Day, *Fish. Ind.*, 646; *Fau. Br. Ind.*, I., 384.
 Vern.—*Polassah-fessah, phasah*, BENG.
 Habitat.—The Bay of Bengal; the young are common in the Sunderbans. Largely consumed by the native population.
- 557 *Rasbora buchanani*; Day, *Fish. Ind.*, 584; *Fau. Br. Ind.*, I., 337.
 Vern.—*Rasbora*, BENG.
 Habitat.—The rivers of India, Assam, and Burma. Most common in the valley of the Ganges and along the Coromandel coast. Used as food by the Natives.
- 558 *R. daniconius*; Day, *Fish. Ind.*, 584; *Fau. Br. Ind.*, I., 336.
 Vern.—*Mile-to-ah*, HIND.; *Danikoni, angjani*, BENG.; *Jilo, dundikerri*, URIYA; *Doh-ni-ko-nah*, ASSAM; *Chin-do-lah, raan-kaal-le, charl*, PB.;

 Habitat.—The fresh waters of India, Ceylon, Burma, and Cochin-China, attaining 1 foot or more in length. It is considered exceedingly wholesome and invigorating by Natives, though in some places deemed impure by the Brahmins. In Burma it is salted.
- 569 *Saurida tumbil*; *Day, Fish. Ind., 504; Fau. Br. Ind., I., 410.*
 Vern.—*Uluway, cul-nahmacunda*, TAM.; *Arranna*, MALAY.; *Badimottah*, VIZAG.
 Habitat.—Seas of India. Though rather dry and insipid it is considerably used as food.
- 570 *Sciæna bleekeri*; *Day, Fish. Ind., 185; Fau. Br. Ind., II., 112.*
 Vern.—*Soh-li*, BENG.
 Habitat.—Bombay. This species is extensively salted at Gwadur.
- 571 *S. coitor*; *Day, Fish. Ind., 187; Fau. Br. Ind., II., 115.*
 Vern.—*Coitor*, BENG.; *Botahl, putteriki*, URIYA; *Vella-ketcheli*, TAM.; *Nga-ta-dun, nga-pok-thin*, BURM.
 Habitat.—Throughout the larger rivers of India and Burma, descending to the sea at certain seasons.
- 572 *S. cuja*; *Day, Fish. Ind., 187; Fau. Br. Ind., II., 115.*
 Vern.—*Cuja*, BENG.
 Habitat.—The estuaries of the Ganges.
- 573 *S. diacanthus*; *Day, Fish. Ind., 189; Fau. Br. Ind., II., 118.*
 Vern.—*Chaptis*, BENG.; *Katcheli, nalla-katcheli*, VIZAG.; *Ikan sam-bareh*, MALAYS.
 Habitat.—The seas of India, ascending tidal rivers and estuaries. It is found in the Hooghly as high as Calcutta.
- 574 *S. maculata*; *Day, Fish. Ind., 190; Fau. Br. Ind., II., 119.*
 Vern.—*Cûrûwa, vari katcheli*, TAM.; *Cutlah*, MALAY.; *Sari-kullah*, VIZAG.; *Taantah*, BEL.
 Habitat.—The seas of India. It is not considered such a good food fish as the other species.
- 575 *Scomber microlepidotus*; *Day, Fish. Ind., 250; Fau. Br. Ind., II., 203.*
 THE MACKEREL.
 Vern.—*Karah*, BENG.; *Karna-kita*, or *karnang-kullutan*, TAM.; *Kana-gurta*, TEL.; *Cunny-ila*, MAD.; *Ila*, MALAY.; *Kanagurta*, VIZAG.; *Nga-congrî*, MUGH.; *Lûk-wa-dah*, ANDAMANS.
 Habitat.—Indian seas. A small fish rarely exceeding 10 inches in length, very common throughout the cold season in Malabar. It is extensively salted and dried, but although good eating is seldom brought to the tables of Europeans, as it rapidly taints, and if eaten in that condition gives rise to visceral irritation.
- 576 *Semiplotus mc'clellandi*; *Day, Fish. Ind., 550; Fau. Br. Ind., I., 281.*
 Vern.—*Sundari, sentori, lah-bo-e, rajah-mas* (=“King's fish”), ASSAM.
 Habitat.—The rivers of Assam, especially the upper portions of that district, but found as low as Goalpara; also in Burma. It is asserted that this fish obtained the vernacular name of “king fish,” owing to the

of Economic Value

(J Murray)

FISH

fact that in olden times, when captured, it had always to be taken to the Rajas for their own consumption Day, however, remarks that, as it is very common, this explanation is improbable, and it is more likely that it was so named from a tax being levied on its capture Very varying accounts of the value as food of the *Semplotus* exist McClelland states that it is the most delicious in Assam, while Day records from personal experience that it is rich and liable to set up intestinal irritation

FLACOURTIA
MORRELL.

The Many-spined Flacourtia.

FLACOURTIA, Comm. Gen., Pl. L. 128.

A genus of trees or shrubs, often spinous, containing about twelve species, native to the Old World, of which some are cultivated in tropical countries. There are eight Indian species, of which five are of economic interest.

503

Flacourtia Cataphracta, Roxb.; Fl. Br. Ind., I., 193.

Many-spined Flacourtia, Eng.; PRUNIER D'INDIE, Fr.

Vern.—*Takshatri*, *pamamalai*, *anti-morrola*, HIND.; *Paididi*, BENG.; *Sampama*, *tempati*, *jaggam*, BOMB.; *Tambat*, MAL.; *Talishpila*, GUZ.; *Talishpila*, TAN.; *Talishpila*, TEL.; *Nevada*, BURM.; *Prachinamala*, *talishu*, SAMS.; *Tarnab*, ALAB.; *Talishpata*, PERS.

Soc., 1847, 60, II., 2; *Home Dept.* Cor., 26; *Tournef.* Agr.-Hort. Soc., XII., 324.

Habitat.—A small tree of Assam, Bengal, Burma, Bombay, and the Western Ghats. Commonly cultivated in India.

Oil.—The stems yield an oil, of which little is known, but further information regarding it might lead to the opening up of a trade in an article which even the poorest cultivator might supply from the wild plant.

Medicine.—The leaves and young shoots taste like rhubarb, and are supposed to possess astringent and stomachic properties. They are prescribed in diarrhoea, weakness, and consumption. An infusion of the l. a. l. is also given for hoarseness. The fruit is said by Dymock to be recommended as useful in bilious conditions.

Compare with *Abies Webbiana*.

Syn. and Opinions.—§ "The leaves are said to have diaphoretic properties" (*Deputy Sanitary Commr. Fawcett Parker, M.D., Poona*).

"Used as a purifier in chronic bronchitis" (*Surgeon-Major F. J. L. Ratton, M.D., Salem*). "Sold in Mysore bazzars and used in combination with other drugs for cough, &c." (*Surgeon-Major John North, Bangalore*).

"Under the name *Talishpata* are sold in the bazaar the leaves of a pine (*Abies Webbiana*)" (*Asst. Surgeon Sahkaram Arjun Rawat, L.M., Gorraum, Bombay*). *Talishpata* is probably this plant and not *Abies*.—Ed.

Food.—Taylor in his "Topography of Dacca" writes: "The fruit of this tree, which is of a purple colour, and of the size and appearance of a plum, is sold in the city during the rains." Dr. Watson reports that the fruit is eaten in Aliahabad. It is also generally used as an article of food in Assam.

Structure of the Wood.—Heavy, brown, close-grained, rather hard and brittle, and takes a fine polish (*Kurz*, For. Fl. Burma).

F. inermis, Roxb.; Fl. Br. Ind., I., 193.

Vern.—*Tamizani*, MAL. (S.P.); *Tambat*, *jaggam*, BOMB.; *Ubbolu*, KAN.

References.—*Roxb.*, Fl. Ind., Ed. C.B.C., 739; *Kurz*, For. Fl. Burma., 74; *Gamble*, Man. Timb., 17; *Lisboa*, U. P. Bomb., 7, 126.

Habitat.—A middling-sized tree, probably introduced from the Moluccas. At present found in Sylhet, South India, and Martaban. It blossoms during the dry season, and ripens its fruit towards the close of the rains.

Food.—The fruit, says Roxburgh, is too sour to be eaten raw, but makes very good tarts. In the Moluccas, however, it is eaten.

F. montana, Griseb., Fl. Br. Ind., I., 192.

Vern.—*Attak-ke-iar*, *attak*, BOMB.; *Champer*, MAL.; *Hannu sampige*, KAN.

Habitat.—A very thorny tree found in Kanara and the Concan.

Food.—"The fruit—used as a fruit" (*Birdwood*, Bom. Products).

Flame Trees : Waras Dye.

being on fire—hence the popular name Flame Trees. The principal trees of this nature are :—

Amherstia nobilis.

Bombax malabaricum.—Silk Cotton Tree.

Butea frondosa and *superba*.—Tésú Flowers.

Cæsalpinia pulcherrima.—Barbadoes Pride or Gold Mohur Tree
(a corruption of the Hind. name *Gulmor* or Peacock Flower).

Cochlospermum Gossypium.—White Silk Cotton Tree.

Lagerstroemia Flos-Reginæ.

Poinciana regia.—The Mascarene.

Pterospermum acerifolium.

Rhododendron arboreum, &c., &c.

Flax, Common, see *Linum usitatissimum*, Linn. ; LINEÆ.

631 Flax (New Zealand). The fibre of *Phormium tenax*.

632 Flea-bane.

A powder made of the dried flowers or seeds of several species of plants for the destruction of, or rather driving away of, fleas.

In Persia the flowers of three species of *Pyrethrum* are employed. In India the flea-bane, commonly used, is the *Purple Flea-bane* or seed of *Veronia anthelmintica* (Willd.). See *Pyrethrum* and *Veronia*.

Fleece of Sheep, see *Skins*.

(G. Watt).

Habitat.—An erect, woody shrub, common in the thickets and forests of the warmer parts of India.

The *Flora of British India* reduces to this species the following forms described by Roxburgh as distinct (see *Ed. C. B. C.*, pp. 571-72) :—

F. procumbens, *F. prostrata*, *F. nana*, *F. congesta*, and *F. semialata*, forming four varieties :—

634 *Var. 1—semialata* (sp. Roxb. ; syn. *F. stricta*, Will. ; *F. prostrata*, Roxb.)—Central Himālaya, ascending to 5,000 feet in altitude.

635 *Var. 2—latifolia* (sp. Benth.)—Khasia Hills, altitude 2,000 to 3,000 feet.

636 *Var. 3—Wightiana* (sp. Grah.)—Nilghiris, Bhutan, Ava.

637 *Var. 4—nana* (syn. *F. procumbens* Roxb. ; *F. capitata*, Ham.)—Central and Eastern Himālaya and the Concan.

HISTORY.
638

Modern Commercial History of *Waras Dye*.—In a correspondence forwarded by the Secretary of State for India to the Revenue and Agricultural Department, Sir J. D. Hooker communicated certain facts regarding the *Waras* drug and dye of Africa which led to the suggestion that that substance was obtained from a *Flemingia* and probably one of the forms of the common Indian species *F. congesta*. Roxburgh nearly a century before had drawn attention to the garnet-coloured hairs on the pods of

F. 638

The Waras Dye.

(G Watt)

FLEMINGIA
congesta.

that plant, but was apparently ignorant of the fact that these yielded a valuable dye. In the Kew Report for 1881 further information was published regarding *waras*, and it was there suggested that it was in reality obtained from the African species *F. rhodocarpa*. The Director of the Madras Indian species has since sent me a sample of the dye obtained by Mr. Wardle,

HISTORY.

Baker, F.R.S., in the 'Flora of Tropical Africa,' as *Flemingia rhodocarpa*. But my colleague, Professor Oliver, F.R.S., whose kindness is only equalled by his sagacity, has made the curious discovery that a *Flemingia* apparently confined to South India, *F. Grahamiana*, IV & A, is not specifically distinguishable from *F. rhodocarpa*; the pods are in fact clothed with the same peculiar epidermal glands so characteristic of that species. The '*waras*' plant is therefore really to be found in India after all. In creating a new species for the '*waras*' plant, Mr. J. G. Baker pardonably neglected the comparison of the material he was working upon with specimens of the species occurring in so remote and botanically

ly both *F. rhodocarpa* and *F. Grahamiana* would have to be referred, along with *F. congesta*, to forms of one species. It is on the probability of such a rearrangement and as a matter of economy of space that the writer has thrown the present account of the African *waras* into one place and under one species instead of attempting to discuss it under several.

Dye.—Mr. Lawson wrote of his experiments with the Indian powder procured by him from *F. Grahamiana* and *F. congesta*: "The *waras* yields a beautiful dye when applied to animal substances such as silk or wool, but it is inferior as a dye when used for the purpose of colouring vegetable products such as cotton or linen. Mr. Threlton Dyer has kindly obtained for me a London expert's opinion upon the value of *waras*, and I regret to say that it is not such as is likely to lead one to believe that it will ever become an object of commercial interest. I may mention that when I was in Madras last winter, I saw at the Agri-Horticultural Gardens flower-show a specimen of *waras* in a native dyer's

DYE.
639

all kinds of allowance as the dye property of the *Flemingia* and Mr. A. Campbell, in his Report on the Economic Products of Chutia Nagpur,

FLEMINGIA
congesta.

The Waras Dye.

DYE.

writes of *F. congesta* : "The pods are said to yield a dye." It would thus appear that the Santals are familiar with the dye, and as Mr. Campbell does not call this *waras*, there is no room for doubting but that he alludes to a fact, the interest of which, beyond the limits of his own province, Mr. Campbell was in all probability not aware of.

It may serve a useful purpose to reproduce here Major Hunter's description of the collection and purification of the dye as pursued in Africa, at Harrar :—

"In the neighbourhood of the city '*waras*' is not now raised from seed sown artificially, and it is left to nature to propagate the shrub in the surrounding terraced gardens. The plant springs up, among jowari, coffee, &c., in bushes scattered about at intervals of several yards, more or less. When sown, as among the Gallas, it is planted before the rains in March. If the soil be fairly good a bush bears in about a year. After the berries [pods] have been plucked, the shrub is cut down to within six inches of the ground. It springs up again after rain and bears a second time in about six months, and this process is repeated every second year until the tree dies. Rain destroys the berry [pod] for commercial purposes ; it is therefore only gathered in the dry season ending about the middle of March. The bush grows to a maximum height of six feet, and it branches close to the ground. The growth is open and the foliage sparse. Each owner has a few acres of land.

"In the middle of February 1884, the following processes were observed :—

"The leaves [? fruiting shoots] of some plants were plucked and allowed to dry in the sun for three or four days. (The picking is not done carefully and a considerable quantity of the surrounding twigs, &c., is mixed with the berries [pods].) The collected mass was placed on a skin heaped up to about six or eight inches high and was tapped gently with a short stick about half an inch thick. After some time the pods were denuded of their outer covering of red powder which fell through the mass on to the skin. The upper portion of the heap was then cleared away and the residual reddish green powder was placed in a flat woven grass dish with a sloping rim of about an inch high. This receptacle was agitated gently and occasionally tapped with the fingers, the result being the subsidence of the red powder and the rising to the surface of the chaffy refuse, which latter was carefully worked aside to the edge of the dish and then removed by hand. This winnowing was continued until little remained but red powder. (No great pains are even taken to eliminate all foreign matter.) A *rotl* was sold in 1884 for about 13 piastres=1 rupee 10 as. nearly.

" '*War*' is sent to Arabia, chiefly to Yemen and Hadhramaut, where it is used as a dye, a cosmetic, and a specific against cold. In order to use it, a small portion of the powder is placed in one palm and moistened with water ; the hands are then rubbed smartly together, producing a lather of a bright gamboge colour, which is applied as required " (*W. T. Thiselton Dyer, Pharm. Jour., May 31, 1884*).

Mr. Wardle regards *waras* as a distinctly inferior dye to *kamāla* (*Mallotus philippinensis*). The latter has been exported from India to Europe for many years past as an adulterant or substitute for the former. Mr. Wardle writes of *waras* : "This substance contains only a small amount of colouring matter compared with the vegetable yellow dyes of commerce, and no colour can be obtained from it which will bear comparison in depth and richness with those produced from *kamāla* or *kapila*, for which, as stated in the Kew Report for 1880, it is used as a substitute, and which is certainly a very much more valuable dye-stuff.

The Waras Dye.

(G. Watt) FLEMINGIA
vestita.

"As far as my observations have gone, *waras* is inferior to *kamala* in permanence, as regards the action of light." "The colour produced with *waras* is easily turned brown by alkaline solutions, whilst *kamala* is only slightly reddened. Both dyes, however, resist the action of acids

DYE.

shade"

In Bombay the word *waras* (as a pure coincidence probably) is given

It would thus appear clear that from whatever cause has proceeded the confusion which till recently existed in modern literature, the early writers fully understood the properties and sources of the two plants—*kamala* and *waras*

Animal Flesh : Flint : Fluor-spar.

elliptical and about an inch long" (*Lindley and Moore's Treasury*). The writer has never seen it cultivated, nor can he discover any Indian author who alludes to this fact, but around Simla the plant is very plentiful, and along with *Vigna vexillata*—the *gúlái* or *ban* (wild) *mung*, of the N.-W. Himálaya—the roots are regularly collected and eaten, especially by herd boys attending on cattle. They have a sweet, agreeable, nutty flavour, and if systematically cultivated might come to afford a useful new vegetable somewhat of the character of the Jerusalem Artichoke. The Himálayan form has few flowers, much less crowded than in the variety described as *nilgherensis*; *Wight, Ic., t. 987*.

(*F. Murray.*)

FLESH, Animal.

In India the flesh of animals is not only used as a food, but from very early times has been much employed medicinally by native practitioners, both internally as *ghritas*, and externally as *taila páka*.

Food.—Sanskrit writers describe the different properties of the flesh of various animals in great detail. By them the flesh of the goat, domestic fowl, peacock and partridge, is said to be easily digested and suited for the sick and convalescent; the meat of the deer, sambar, hare, quail, and partridge is recommended for habitual use; while beef and pork are viewed as hard to digest and unsuited for daily use.

Medicine.—Medicinally the goose, fowl, jackal, goat, snail, and mungoose are principally employed, their flesh being prescribed for many forms of disease, but chiefly those of the nervous system.

The *ghrita* and the *taila páka* into which they are compounded contain in addition a great variety of vegetable drugs (*U. C. Dutt, Hind. Mat. Med., p. 286*).

FLINT.

Vern.—*Chakmak*, HIND.; *Chakimuki*, TAM., TEL.

Flint is a massive compact form of almost pure silica and is generally of a dark-brownish colour. It breaks with a conchoidal surface, and forms sharp cutting edges. True flints are of rare occurrence in India, but in the manufacture of implements in prehistoric times, horses' bones, agates, &c., were substituted, and some of these form efficient gun-flints, or flints for flint and steel.

Flints are said to be found at Coorchycolum in the Trichinopoly district of Madras (*Manual of the Trichinopoly District, p. 67*); in the Dharwar district of Bombay (*Madras Jour. of Lit. and Sci., Vol. XI., p. 46*); in the Bannu district of the Panjáb (*Baden Powell's Pb. Prod., p. 46*; and in Afghánistan immediately across the Kurram (*Records, G. S. I., XII., p. 111*).

Owing to the extensive use of the chalcidonic quartzes in place of the true flint it is difficult to decide whether the mineral reported to be found in the above situations is real flint or not.

Uses of.—Flint when calcined and ground, is used in the manufacture of pottery, and in the natural condition for gun-flints.

Flour, see *Triticum sativum*, Lamk., and *Oryza sativa*, Linn.; GRAMINEÆ.

Flower Fence, see *Cæsalpinia pulcherrima*, Swartz., Vol. II., 10.

Flower oil, see *Sesamum indicum*, D.C.; PEDALINEÆ.

FLUOR-SPAR.

Derbyshire Spar.—This mineral consists of calcic fluoride. Found in India only in very small quantities, probably owing to the small number of metal mines at present worked.

Habitat.—This perennial attains a height of 5 to 6 feet, and is commonly cultivated throughout India at all altitudes up to 6,000 feet; but is sometimes also found wild. Several cultivated races seem to grow in India, but these do not appear to have been botanically recognised. The seed is smaller and straighter than that of the European fennel, but is otherwise similar.

Cultivation.—This plant seems in India generally to be grown only in small patches in homestead lands, as a cold-weather crop. The method of cultivation is that of an ordinary market-garden crop. In Bombay, however, it appears to be cultivated to a larger extent. The following account has been received from the Director of Land Records and Agriculture, dated September, 1889:—"In 1887-88 Fennel occupied 1,454 acres, of which 834 acres were in Khândesh. It is grown in some districts of Gujarat and the Deccan. In the former district it is grown in *gorat*, light soil moderately manured—10 cart-loads to the acre. The land is ploughed, harrowed, and rolled three times between June and October. About 9½ of seed per acre are scattered by hand into beds, which are irrigated once a fortnight until January. The crop is cut in rather a green state, and allowed to lie in the ground for five days. The acre yield varies from 280 to 1,120½—720½ being a good average crop. In the gardens in the Deccan it is sown at any time. It is also sown on the edges of dry crops in July and August. The probable total yearly outturn is estimated at 13,000 maunds, and the price realised varies from R6 to R8 per Indian maund."

Chemistry.—Fennel fruit yields about 3 per cent. of volatile oil, anethol or anise camphor, and a variable proportion of a liquid isomeric with turpentine. Anethol (the constituent, important medicinally and as a flavouring agent) may be obtained either as a liquid or crystal, as it takes the latter form at a moderately low temperature (*Pharmacographia*, 275).

Oil.—The fruit contains a volatile oil, pale yellow, with a pleasant aromatic odour. It is used in Europe in the manufacture of cordials, and enters into the composition of fennel water which is employed medicinally, but chiefly as a vehicle for other drugs. This water is distilled largely in India and sold under the name of *Arak baddian*.

Medicine.—The FRUITS are used medicinally as a stimulant, aromatic, and carminative, and are prescribed in colic, diarrhoea, and dysentery. The ROOT is regarded as purgative, and the LEAVES as diuretic.

Besides these properties it is believed, in some parts of the country, that the fruits have a specific value. Thus in Madras they are said to be used as a medicine in venereal diseases.

SPECIAL OPINIONS.—§ "Stimulant, aromatic, and carminative in colic" (*Assistant Surgeon Nehal Sing, Saharunpore*). "The infusion of the seeds is used as a cooling drink in fever, &c." (*Civil Surgeon F. H. Thornton, B.A., M.B., Monghyr*). "The seeds fried and powdered are used in dysentery with sugar" (*Assistant Surgeon T. N. Ghose, Meerut*). "Cold infusion of seeds very useful in colic and indigestion of children, and an excellent vehicle for other medicines. Used also to relieve thirst in fever" (*Assistant Surgeon Shib Chunder Bhattacharji, Chanda, Central Provinces*).

Food.—The plant is frequently cultivated as a pot-herb in the plains. Its LEAVES are strongly aromatic and are used in fish sauces. Roxburgh wrote: "This plant is cultivated in various parts of Bengal during the

FOOD &

FODDER
PLANTS OF
THE PLAINS

Food and Fodder.

- Acacia lenticularis*, *Horn.* Cattle eat the leaves and small branches.
- A. leucophloea*, *Willd.* Leaves and pods. The latter, however, are considered by some to be poisonous and should be used with caution.
- A. modesta*, *Wall.* The leaves and fallen blossoms are collected as cattle fodder.
- A. Suma*, *Kurz.* *Vern. Syed Khir.* Leaves and young branches (*R. Thompson*).
- Achyranthes aspera*, *Linn.* According to Mr. T. N. Mukharji, the young plants are given to cattle in Bengal in times of scarcity.
- Adhatoda Vasica*, *Nees.* The Conservator of Forests, Northern Circle, Bombay, states that the leaves supply fodder for cattle. This plant is abundant in Northern India, but appears to be there used only as a medicine for cattle for the cure of colic.
- Adina cordifolia*, *Hook. f.* Leaves (*R. Thompson*).
- Ægle Marmelos*, *Correa.* Bael tree. Brandis mentions that the twigs and leaves are lopped for cattle fodder.
- Azua javanica*, *Just.* Plant (*R. Thompson*).
- Ailanthus excelsa*, *Roxb.* Leaves (*R. Thompson*).
- Albizia amara*, *Bislin.* Leaves (*R. Thompson*).
- A. Lebbeek*, *Benth.* *Vern. Siris.* In Mysore the leaves of this tree are considered to be good fodder for cattle.
- A. odoratissima*, *Benth.* The branches are lopped for cattle fodder.
- A. procera*, *Benth.* Leaves (*R. Thompson*).
- A. stipulata*, *Roxb.* The branches are lopped for cattle fodder.
- Allium Cepa*, *Linn.* Boiled onions are given with other food to milch cows and buffaloes in the Nasik District.
- Alysicarpus rugosus*, *DC.* This and other species are eaten by cows and buffaloes in Bundelkhand.
- Amarantus spinosus*, *Linn.* This common wayside weed is often given to milch cows in Bengal. Mr. T. N. Mukharji says that chopped up and mixed with the boiled ends of rice-stems, "the preparation is considered highly lactiferous." Other species of *Amarantus*, many of which are cultivated as pot-herbs, might be substituted with advantage.
- Amorphophallus campanulatus*, *Bl.* According to Mr. T. N. Mukharji this plant when dead and dry is greedily eaten by cattle in Bengal, and householders occasionally collect it for their cows.
- Anogeissus acuminata*, *Wall.* } Leaves (*R. Thompson*).
- A. latifolia*, *Wall.* }
- A. pendula*, *Elger.* Bhai Sadhu Singh, Forest Officer to the Jeypur State, says that buffaloes and cattle eat the dry leaves of this tree.
- Anthocephalus Cadamba*, *Benth. & Hk. f.* The leaves are sometimes used as cattle fodder.
- Antidesma diandrum*, *Roth.* "Cattle eat the leaves" (*Rev. A. Campbell, Chutia Nagpur*).
- Arachis hypogæa*, *Linn.* The ground-nut is cultivated in many parts of India, especially in the Bombay and Madras Presidencies. The stems and leaves, fresh or dry, are greedily eaten, and the oilcake is an excellent food for fattening cattle and increasing the quantity of their milk.
- Argyrea speciosa*, *Sweet.* Leaves (*Rev. A. Campbell*).
- Artocarpus integrifolia*, *Linn.* The leaves of the jack-fruit tree are considered fattening for cattle; and according to Mr. T. N. Mukharji the rind of the ripe fruit is "greedily eaten by cattle as the greatest of luxuries."
- A. Lakoocha*, *Roxb.* Extensively lopped for cattle fodder (*R. Thompson*).
- Atriplex nummularia*, *Lindl.* Baron Von Mueller in his *Select Plants*,

- ripens in three months. A first-class crop is that which yields a good fodder crop of leaves first and a heavy root-crop afterwards (see *Gaz. of Fhang District*, p. 111). In the Gujranwala district turnips are largely grown, often amongst the wheat in the highly-cultivated lands bordering the Chenab, grass being very scarce. A dry season is favourable to a good crop of turnips, and an extension of their cultivation would alleviate one of the worst dangers of a drought, the failure of fodder for cattle (*Gaz. of Gujranwala*, p. 54). In the district of Dera Ismail Khan turnips are grown principally as cattle fodder, and in the Kachi tracts as a head rather than as a root crop. They are extensively cultivated in the Montgomery district, and from the middle of November the crop is used as fodder. In Muzaffargarh they are mostly used as fodder, and ripen just in time to relieve the failing stocks of other kinds of fodder. In the Multan district cattle are fed on turnips from 15th November to the 1st February.
- Brassica campestris*, Linn., var. *Toria*. Often used as green fodder in the Karnal district (Panjáb).
- B. juncea*, H. f. & T. Sometimes given as green fodder, when other kinds of food are scarce.
- Briedelia montana*, Willd. The leaves are lopped for cattle fodder (*Brandis*).
- B. retusa*, Spreng. The leaves are valued as fodder and the tree is frequently lopped (*Brandis*). Cattle fed on these leaves are said to be cured of worms.
- Broussonetia papyrifera*, Vent. (Paper Mulberry) This valuable fibre plant can be easily cultivated in almost any kind of soil, and the foliage will probably be found to be a useful fodder for cattle.
- Buchanania angustifolia*, Roxb. Buffaloes eat the leaves (*R. Thompson*).
- B. latifolia*, Roxb.—The leaves of this tree are said to be given as fodder in the Savantvadi district, Bombay; and according to Mr. R. Thompson they are similarly employed in the Central Provinces.
- Bursera serrata*, Colebr. Buffaloes eat the leaves (*R. Thompson*).
- Butea frondosa*, Roxb. The *Dhák* tree. Buffaloes are very fond of the leaves, and their milk is said to be improved thereby. They are said to be more wholesome if given when not quite fresh. Camels and goats will not touch this tree.
- B. superba*, Roxb. A large climbing shrub, the leaves of which, according to the Rev. A. Campbell, are eaten by cattle in Chutia Nagpur, and by buffaloes as stated by Mr. R. Thompson.
- Buettneria herbacea*, Roxb. Plant (*R. Thompson*).
- Cajanus indicus*, Spreng. VERN. *Arhar*. Largely cultivated in most parts of India. The leaves and pod-shells are considered excellent feeding for cattle. The husks and broken grain soaked in water are sometimes given to cattle to keep them quiet when being milked.
- Calendula officinalis*, Linn. A weed of cultivation in the Western Panjáb and Sind. It is supposed to increase the flow of milk in cows.
- Calotropis gigantea*, R. Br. In Chutia Nagpur cattle eat the leaves (*Rev. A. Campbell*).
- C. procera*, R. Br. Cattle will eat the dried leaves.
- Careya arborea*, Roxb. The fruit is said to be eaten by cattle in the Kánara district of Bombay.
- Carthamus tinctorius*, Linn. The chaff of this plant is said to be sold as fodder for cattle in the Bulandsharh district. The oil-cake is rather bitter, and is apt to taint the milk.
- Cassia Fistula*, Linn. VERN. *Amaltás*. The twigs and leaves are lopped for cattle fodder in Oudh and Kumaon (*Brandis*).

PLANTS OF
THE PLAINS

Ceratonia Siliqua, Linn (The Carob tree) Cattle are fond of the sweet pods and will also browse on the foliage, if allowed to do so. Baron Von Mueller states that "in some of the Mediterranean countries horses and stable cattle are almost exclusively fed upon the pods. The fattening properties of these pods, which contain about 66 per cent of sugar and gum, are twice those of oil-cake. To horses and cattle 6lb a day without chaff."

The *ovum* is carefully preserved as cattle food when the grain is thrashed, or trodden out by cattle, the pod shells are separated by winnowing and used as manure or burnt, as they are considered, owing to their sharpness, liable to injure the mouths of cattle.

Cistanche tubulosa, Wight A curious and rather handsome herb, parasitical on the roots of *Aerua javanica* and *Calligonum polygonoides*, and found on sandy ground in parts of the Panjáb and in Sind. Stewart, under its synonym *Phelpsea Calotropidis*, Walp, says that the upper portion of the plant is given as fodder to oxen.

Citrullus Colocynthus, Schrad The fruit is said to be relished by buffaloes.

C vulgaris, Schrad —(Water-melon) In the Dera Ismail Khan district cattle are sometimes fed on the raw fruit, and the seeds are carefully preserved as cattle food during the winter. The seeds are also given to cattle in the Mallámi district of Rájpútana.

Clerodendron phlomoides, Linn f. } Buffaloes eat the leaves (R Thomp-

Cocculus villosus, DC Cows and buffaloes eat it (Roxburgh under *Memspermum hirsutum*).

Cochlospermum Gossypium, DC. Buffaloes eat the leaves and flowers (R Thompson).

Colebrookia oppositifolia, Smith Buffaloes are said to be fond of the leaves of this shrub.

Colocasia antiquorum, Schott In Bengal, according to Mr. T N Mukharji, yams are cut into small pieces and boiled either alone or mixed with rice ends or with portions of *Amarantus spinosus*, and given to cattle.

PLANTS OF
THE PLAINS.

- Combretum ovalifolium*, *Roxb.* Buffaloes eat the leaves and young shoots (*R. Thompson*).
- Commelina bengalensis*, *Linn.* This plant is said by Bhai Sadhu Singh to be given as fodder to cattle in the Jeypur State.
- Convolvulus arvensis*, *Linn.* Gathered by village children as fodder for cattle (see *Vol. II., p. 519*).
- C. pluricaulis*, *Chois.* Mentioned by Stewart as being eaten by cattle, and considered cooling.
- Corchorus olitorius*, *Linn.* (Jute.) Leaves eaten by cattle after the plant is cut for fibre.
- Cordia Macleodii*, *H. f. & T.* Buffaloes eat the leaves (*R. Thompson*).
- C. Myxa*, *Linn.* The leaves are given to cattle.
- C. Rothii*, *R. & S.* Buffaloes eat the leaves (*R. Thompson*).
- Cratæva religiosa*, *Forst.* Buffaloes eat the leaves and fruit (*R. Thompson*).
- Crinum*, *sp.* The flowers of this (apparently undescribed) species are, according to the Rev. A. Campbell, eaten by cattle.
- Crotalaria juncea*, *Linn.* (Sunn Hemp.) Cultivated for its fibre, and also, according to Roxburgh, in parts of the Northern Circars as a fodder plant for milch cows. The stems are used as fodder in the Kistna district (Madras), and also in Godaveri, where they are stored in bundles, and covered over with palmyra leaves to protect them from rain. The seeds are also collected and given to cattle in some parts of India.
- C. linifolia*, *Linn. f.* An annual, common throughout India. Roxburgh says that cattle eat it.
- C. medicaginea*, *Lamk.* The plant is eaten by cattle in Bundelkhand and Rájputána.
- Croton oblongifolius*, *Roxb.* Cattle eat the leaves in Chutia Nagpur (*Rev. A. Campbell*).
- Cyamopsis psoralioides*, *DC.* VERN. *Guár.* Cultivated during the rains in various parts of India. The pods are used as human food, and the seeds are given to cattle and horses; in the former case it is grown as a garden crop, and in the latter as a field crop, being often sown with *bájra*. It is largely grown for cattle in the Meerut Division; also in some of the Panjáb districts in light soils. It is sometimes given green to bullocks.
- Cyanotis axillaris*, *R. & S.* "Cattle are very fond of this plant" (*Roxburgh*).
- C. tuberosa*, *R. & S.* Cattle eat the plant (*Rev. A. Campbell*).
- Cyperus longus*, *Linn.* Mr. T. N. Mukharji says that in Bengal this plant is weeded out from fields and given to cattle.
- C. rotundus*, *Linn.* VERN. *Mothá.* Cattle eat this plant. Other species of CYPERACEÆ, known under the general name of *dila*, are eaten by cattle, and especially by buffaloes.
- Dalbergia lanceolaria*, *Linn.* Buffaloes eat the leaves (*R. Thompson*).
- D. latifolia*, *Roxb.* In Oudh, according to Brandis, the tree is pollarded for cattle fodder. In the Bombay Presidency also it is said to be used for fodder.
- D. Sissoo*, *Roxb.* (The Shisham tree.) Cattle are fond of the young shoots and leaves, and will browse freely on them if allowed to do so.
- D. volubilis*, *Roxb.* Cattle eat the leaves in Chutia Nagpur (*Rev. A. Campbell*), and in the Central Provinces (*R. Thompson*).
- Daucus Carota*, *Linn.* (The Carrot.) A most valuable crop for tracts affected by periodical droughts. Cattle eat both the tops and the roots, and in Kolhápúr they are frequently given to milch cows. In Cutch carrots are largely grown both for fodder and for pickling.

FOOD &

Food and Fodder.

I.
FODDER
PLANTS OF
THE PLAINS.

- (*T. N. Mukharji*). In dry seasons buffaloes eat the leaves (*R. Thompson*).
Marsdenia tenacissima, *W. & A.* Buffaloes eat the leaves (*R. Thompson*).
Medicago denticulata, *Willd.* A cold-season weed, largely used as green fodder in the Panjáb, and considered good for milch cows.
M. lupulina, *L.* (Hop-trefoil) A cold-season weed of Northern India often collected for fodder, and worthy of cultivation in the Panjáb. Sutton, in his "Permanent and Temporary Pastures," p. 71, says that the herbage is more nutritious than that of Red clover, and helps to make a good bottom to a pasture, and that it is supposed to impart colour and good flavour to butter.
M. sativa, *Linn.* Lucerne is now well known all over India as a very valuable green fodder crop, especially for horses. It should be given, however, only as a supplement to the ordinary food, as animals will always suffer if allowed to eat as much of it as they will. Mixed with the chopped straw of oats, barley, or wheat, it forms a very wholesome feed. For further information see the article on Lucerne under *Medicago*.
Melia Azadirachta, *Linn.* (The Neem tree.) } The leaves are said to be
M. Azedarach, *Linn.* (Persian Lilac.) } given as fodder to cattle in the Ahmednagar district of Bombay.
Melilotus parviflora, *Desf.* Very common in Northern India as a cold-season weed of cultivation, and largely used in the Panjáb as green fodder for cattle. It is said to be cultivated in some districts for this purpose. An allied species with white flowers (*M. alba*, *Lamk.*) has been known to give colic to cattle; but all plants, especially of the clover kind, if eaten in excess in the green state, are liable to cause this complaint.
Milium velutina, *Hk. f. & T.* VERN. *Dom-sál.* Buffaloes eat the leaves (*R. Thompson*).
Millettia auriculata, *Baker.* This climber is extensively lopped to afford fodder to buffaloes (*R. Thompson*).
Mimusops hexandra, *Roxb.* VERN. *Khirmi.* Buffaloes eat the leaves in the Central Provinces (*R. Thompson*).
Morinda tinctoria, *Roxb.* VERN. *Al.* In the Rewa Kántha district of Bombay, the leaves are given to cattle when grass and forage are scarce.
Morus indica, *Linn.* The leaves are said to be a good fodder for cattle.
Musa paradisiaca, *Linn.* (The Plantain.) Chopped into small pieces it is largely used as fodder in many parts of India, and according to Mr. T. N. Mukharji it forms the staple food of cattle in parts of the Hughli district. It cannot, however, be very nutritious, and is apt to cause diarrhoea. Mr. Mukharji also says that the white portion of the root is chopped fine and given to cattle, and is a more substantial food than the stems. Cattle are very fond, too, of the skin of the fruit, and the flowers when available.
Nyctanthus Arbor-tristis, *Linn.* VERN. *Harsinghar.* Buffaloes eat the young leaves (*R. Thompson*).
Ochna squarrosa, *Roxb.* Buffaloes eat the leaves in the Central Provinces (*R. Thompson*).
Ocimum canum, *Sims.* Cattle eat the leaves in Chutia Nagpur (*Rev. A. Campbell*).
Odina Wodier, *Roxb.* This tree is often lopped and pollarded, the leaves and branches being a favourite fodder of cattle (*Brandis*).
Olea cuspidata, *Wall.* The leaves are said to be good fodder for cows and milch buffaloes (*Gaz., Rawal Pindi, p. 80*).
Opuntia Dillenii, *Haworth.* (Prickly Pear.) This is the kind which grows so plentifully in Southern India, and were it not for the spines it might be used with advantage as a profitable adjunct to the ordinary food of cattle,

Zizyphus Jujuba, Lamk. VERN. *Ber*. The leaves are much valued as cattle fodder.
Z. nummularia, W. & A. VERN. *Phárberi*. Cattle are largely fed on the leaves of this bush in many parts of India, and it is often a most useful stand-by when other sources of fodder fail.
Z. rugosa, Lamk. Cattle eat the leaves in Chutia Nagpur (Rev. A. Campbell).
Z. xylopyra, Willd. VERN. *Kather*. The young shoots, leaves, and fruit serve as fodder for cattle (Brandis).

II. INDIAN FODDER GRASS—EXCLUDING HIMÁLAYAN SPECIES.

- Æluropus littoralis*, Parl., var. *repens*. Sandy and saline tracts in the Western Panjáb, resembling *dáb* (*Cynodon Dactylon*), which it replaces.
Alopecurus pratensis, Linn. (Meadow Fox-tail.) A common European grass occurring also on the Himálaya and descending to the Panjáb plains. Abundant at Quetta, where it is largely used for feeding horses. Might be cultivated with advantage as a winter grass in many parts of the Panjáb.
Andropogon annulatus, Forsk. An abundant and excellent fodder grass. A variety with the outer glumes 3-toothed, *A. Bladhii*, Retz., is also plentiful.

Food and Fodder.

(J F Duthie)

FODDER

INDIAN
FODDER
GRASS.

Andropogon caricosus, Linn. Plentiful in Bundelkhand and the Central Provinces, and largely used as fodder

A. foveolatus, Del. Abundant on sandy and stony ground, and generally considered to be a good fodder grass

A. Ischæmum, Linn. A good fodder grass resembling *A. annulatus*, but less abundant

A. laevis, Desf. Common in North Western India. Cattle eat this grass readily when it is young and tender, but horses are liable to suffer from colic after feeding on it. It is strongly aromatic, and the scent is often communicated to the milk of cows

A. mucranthus, Kunth, var *villosulus* (Hack Mongr, 490). On Mount Abu, where it is called *Ballak*, and is much valued for fodder. It occurs also on the Himalaya

A. muricatus, Retz (A. squarrosus, Linn f in Hack Mongr, 542). This is the *khas khas* grass the roots of which are employed in making catties. It thrives best on damp low lying land, where, when young, it affords abundance of fodder for buffaloes and in seasons of excessive

A. Central India on black soil, also on
ass for cattle, but not for horses

A. peratus, Willd. VERN *Palwa*. An excellent grass for grazing

A. abundant in Northern and
let it is not considered
the roofing portion of
is supposed to exercise

Apluda aristata, Linn. (A. varia Hack, var *aristata*) Abundant in India amongst bushes, and in forest land often forms a large portion of the undergrowth. Considered to be good fodder when young

Aristida depressa, Retz. Abundant on sandy and stony ground, where it affords good grazing when young

A. hystrix, Linn f. Met with in similar situations, and probably of equal value

Arthraxon lanceolatus, Hochst (Andropogon lanceolatus, Roxb.) Common on rocky ground, and said to be a good fodder grass in Ráputana

Avena sativa, Linn (Oats) First-rate fodder, both green and as hay, especially for horses

Bambusa arundinacea, Retz. A favourite fodder of elephants. The leaves are given to horses as a medicine

Bromus unioloides, H B & K. (Prairie-grass of Australia) Much valued both in Australia and America as a nutritious fodder grass, whether green or dry. Has been tried in India, but as a crop was found inferior to oats

Cenchrus catharticus, Del. VERN *Bhuri*. A characteristic desert grass, and much valued for grazing purposes on account of the early appearance of its foliage

FOOD &

Food and Fodder.

II.
INDIAN
FODDER
GRASS.

- Cenchrus montanus*, *Nees*. VERN. *Anjan*. Flourishes on sandy soils. Very good for grazing and makes excellent hay.
- C. pennisetiformis*, *Hochst. & Steud.* A tall succulent grass, growing in bushy places and often assuming a climbing habit.
- Chloris barbata*, *Swartz.* Considered good for cattle up to the time of flowering.
- C. digitata*, *Steud.* Amongst bushes and under the shade of trees. Is used as fodder in Rájputana.
- C. tenella*, *Roxb.* Said to be a good fodder grass in Rájputana.
- C. tetraetachys*, *Hack. MS.* Apparently confined to the saline usar tracts of the North-Western Provinces, where over considerable areas it constitutes the only vegetation.
- Chrysopogon serrulatus*, *Trin.* (*Andropogon Trinii*, *Steud.* in *Hack. Monogr.*) Common in hilly parts of India, a very good fodder grass, and much liked by horses.
- Coix lachryma*, *Linn.* Largely eaten by cattle in Oudh, and said to be very fattening.
- Cynodon Dactylon*, *Pers.* VERN. *Dáb.* Universally recognised to be the most nutritious and useful fodder grass in this country, whether green or dry, especially for horses.
- Dendrocalamus strictus*, *Nees.* Affords abundant fodder for elephants.
- Dinebra arabica*, *Beauv.* Plentiful in Central India on cultivated ground.
- Diplachne fusca*, *Beauv.* Common on low-lying ground, especially where the soil is saline. Buffaloes appear to be very fond of it.
- Eleusineegyptiaca*, *Pers.* VERN. *Makra.* A common grass, especially on cultivated ground. Said to be very good for cattle, but not for horses.
- E. Coracana*, *Gartn.* VERN. *Mandua* or *ragi.* Cultivated as a grain crop in most parts of India, and largely so in Mysore, where it affords abundance of fodder, both green and as straw. Ragi straw is there considered to be the best fodder for cattle, which are said to work and thrive on it alone, without requiring grass. Horses also are sometimes fed on it when grass is scarce. It is said to improve by keeping.
- E. flagellifera*, *Nees.* VERN. *Chhimbar.* A nutritious perennial species resembling *dáb*, common on sandy ground. In Bikanir it is said to be the best grass for cattle and sheep.
- E. indica*, *Gartn.* Rather a coarse grass, though liked both by horses and cattle.
- E. scindica*, *Duthie.* Like a slender form of *makra*. Said to be a good fodder grass. Found on sandy ground.
- E. verticillata*, *Roxb.* Considered to be a good fodder grass in the Panjáb and Rájputana.
- Elionurus hirsutus*, *Munro.* (*Rottbællia hirsuta*, *Vahl.* in *Hack. Monogr.*) A characteristic desert grass affording excellent grazing when young. Said to be liked by elephants.
- Eragrostis abyssinica.* Introduced from Abyssinia, where it is grown as a cereal under the name of *Teff*. Affords excellent green fodder.
- E. bifaria*, *W. & A.* Common on sandy and rocky ground. Eaten by cattle in Rájputana.
- E. Brownei*, *Nees.* Wet ground. Valued as fodder in Australia.
- E. ciliaris*, *Link.* Sandy ground, good for grazing.
- E. cynosuroides*, *R. & S.* VERN. *Dáb.* A coarse deeply-rooting grass frequent on low-lying waste lands. It is much liked by buffaloes.
- E. elegantula*, *Nees.* Frequent on wet ground. Eaten by cattle.
- E. megastachya*, *Link.* Used as fodder.
- E. nutans*, *Nees.* Plentiful on damp clay soils. Cattle readily eat it when other grasses fail.

FOOD &

Food and Fodder.

II.
INDIAN
FODDER
GRASS.

- Manisuris granularis*, Swartz. According to Coldstream it is prized and stacked at Hissar, but is not much relished by cattle, though at Ajmere it is considered to be a good fodder grass.
- Melanocenchris Royleana*, Nees. Common on sandy ground, and said to afford good grazing when young. It is, however, too small to be of much account.
- Ophiurus corymbosus*, Gaertn. A common black-soil grass, eaten by cattle when young, or when other grasses fail.
- O. perforatus*, Linn. Found on low-lying pastures. Cattle eat it when it is young and green.
- Oplismenus Burmanni*, Retz. Found usually in shady places. Cattle eat it when young, and it is said to make good hay.
- Oryza sativa*, Linn. (Rice.) Rice-straw is the chief fodder in the Madras Presidency, and is stacked in every district. It is usually kept for a few months to season, and will remain good for three years. It is also very largely used as fodder in Bengal and parts of the Bombay Presidency. In Northern India it is less valued. The young shoots after the rice has been harvested afford good pasturage for sheep in the Ratnagiri district. The husks mixed with oilcake are sometimes given to buffaloes. In Burma and Manipur unhusked rice is frequently given to horses.
- Panicum antidotale*, Retz. VERN. *Ghamur*. A tall coarse-looking grass, found in clumps, and often associated with other herbage which, like itself, seeks shelter under prickly bushes. Wingate says that more than three fourths of the grass growing in the Changa Manga plantation consists of this species, and that the natives feed their cattle on the green fodder. In the Sirsa Settlement Report it is stated that cattle are apt to be poisoned if they eat it green. At Hissar, however, according to Coldstream, it is grazed only when young, as it afterwards acquires a bitter and saltish taste.
- P. colonum*, Linn. VERN. *Sawank*. A common weed on cultivated land. Is greedily eaten by all kinds of cattle, both before and after it has flowered, the abundant crop of grain yielded by it adding materially to its nutritive value. Aitchison says that it is sometimes cultivated at Jhelum.
- P. Crus-Galli*, Linn. VERN. *Sauwak*. A coarser plant than the preceding, and usually found near water. Is said to be cultivated in the Lahore district. Cattle, especially buffaloes, are fond of it. In America, where it is known as Barn-yard grass, it is said to be much liked by horses, both when green and dry.
- P. distachyum*, Linn. Common in Northern India. In Australia this species is grown for hay, and is said to be an immense yielder.
- P. eruceforme*, Sibth. & Sm. Common on black and sandy soils in Bundelkhand and Central India, especially on cultivated ground. Yields an abundance of grain.
- P. flavidum*, Retz. Plentiful in the plains, and much liked by cattle and horses. It yields an abundance of grain which contains twice as much oil or fat as that of any other species examined by Professor A. H. Church.
- P. fluitans*, Retz. A water-grass. An abundant grain-yielder.
- P. frumentaceum*, Roxb. VERN. *Sauwan*. Grown as a rainy-season crop chiefly for its grain, but occasionally for fodder. The straw is a good fodder and is much used in parts of Mysore and in the Madras Presidency, though ranked below that of *ragi* and rice.
- P. helopus*, Trin. VERN. *Kuri*. Considered to be a very good fodder grass for horses and cattle. It is a common weed of cultivated ground in the plains, and is found also on the Himálaya at moderate elevations.

[illegible]

FOOD &

Food and Fodder.

II.
INDIAN
FODDER
GRASS.

- Setaria glauca*, Beauv. VERN. *Bandra*. Very common, especially in damp ground. A moderately good fodder, but unsuited for hay.
- S. italica*, Beauv. VERN. *Kangni*. Cultivated for its grain. In parts of Mysore the straw is reckoned as next in quality to that of *ragi*. In the Montgomery district the *bhusa* is considered a strengthening food. It is known in the United States as "Hungarian grass" and is much valued as forage; also in Australia.
- S. verticillata*, Beauv. A coarse grass common in shady places. Cattle eat it when young.
- Sorghum halepense*, Pers. (Andropogon Sorghum, Brot., var. *halepensis* in Hack. Monogr.) VERN. *Baru*. Said to be good for grazing and for hay, but not considered wholesome until after the rains are over. Opinions, however, are at variance on this point. In Australia it is much valued for pasturage and hay, also in the United States, where it is called "Johnson grass."
- S. saccharatum*, Pers. (Andropogon Sorghum, Brot., var. *saccharatus* in Hack. Monogr.) Two varieties were introduced into India about 30 years ago, one called *Sorgho*, from China, and the other from Africa, called *Imphi*. *Sorgho* has taller stems and looser panicles of flowers. It is cultivated in tropical countries for its grain, and in temperate regions for fodder and sugar. The Chinese grow it chiefly for making alcohol. As a fodder plant it is greatly valued. It was first tried in India in 1858, and the result of the experiment showed that though it could not be compared with the ordinary sugarcane of the country as a sugar-yielder, it would prove of great value as a forage plant. Subsequent trials undertaken chiefly in South India, have confirmed this opinion. The Chief Commissioner of Mysore in his report for 1871 observes:—"With respect to the value of *Sorgho* as an article of fodder, there appears to be no doubt that it will grow fairly in this province as a dry crop, i.e., on land not irrigated during the rainy season, and that if cut for fodder before seeding, it is well suited for cattle, especially milch cows, their milk being enriched to an extraordinary degree by its use in small quantities." Mr. Phillips' experiments with *Sorgho* at Allahabad in the years 1872, 1873, 1874 gave some wonderful results in the way of yield and profit. The United States Agricultural Department has declared that the value of *Sorgho* for feeding stock cannot be surpassed by any other crop, as a greater amount of nutritious fodder can be obtained from it in a shorter time, within a given space, and more cheaply. The African *Imphi* is a smaller plant, and though on this account less profitable as a crop it appears to be equally nutritious.
- S. vulgare*, Pers. (Andropogon Sorghum, Brot., in Hack. Monogr.) VERN. *Juár*. Yields excellent fodder, green or dry, which is largely used in various parts of India. It is often specially grown as a fodder crop under the name of *chari*; in which case it is sown earlier and more thickly than when cultivated for the grain. The stalks of certain juicy varieties afford valuable feeding for milch cattle. The chopped-up straw (*karbi*) is much used as cattle food in Northern India. In the Madras Presidency the straw is less valued than that of *ragi*, but is considered superior to that of rice.
- Sporobolus diander*, Beauv. Said to be eaten by horses and cattle.
- S. indicus*, R. Br. A good pasture grass for horses, also given as fodder when young.
- S. pallidus*, Nees. VERN. *Palengi*. A gregarious species common in moist sandy ground, and affording a considerable amount of forage. A variety called *kálusra* constitutes the greater part of the grass vege-

PLANTS.

- Marlea begoniæfolia*, *Roxb.*; **CORNACEÆ**. Tropical and temperate regions. The leaves are collected for sheep fodder.
- Medicago falcata*, *Linn.*; **LEGUMINOSÆ**. Wild and cultivated on the Western Himálaya.
- M. sativa*, *Linn.* Lucerne is cultivated to a small extent at most of the Himálayan stations as green fodder for horses.
- Morus serrata*, *Roxb.*; **URTICACEÆ**. Temperate region. The branches are lopped for cattle fodder.
- Myricaria elegans*, *Rayle*, and *M. germanica*, *Desr.*; **TAMARISCINÆÆ**. Temperate and Alpine regions. Sheep are said to browse on these shrubs.
- Olea cuspidata*, *Wall.*; **OLEACEÆ**. Tropical and temperate regions. The leaves are bitter and are considered to be one of the best kinds of fodder for goats and sheep. Also said to be good for cows and milch buffaloes, both increasing the quantity and improving the quality of their milk.
- O. glandulifera*, *Wall.* Tropical and temperate regions. The leaves are eaten by cattle, sheep, and goats.
- Otostegia limbata*, *Benth.*; **LABIATÆ**. Tropical region. Goats are said to browse on this bush on the Panjáb Himálaya.
- Ougeina dalbergioides*, *Benth.*; **LEGUMINOSÆ**. Tropical region. The branches are lopped as fodder for cattle and sometimes for elephants.
- Oxalis corniculata*, *Linn.*; **GERANIACEÆ**. A common weed in the tropical and temperate regions. Cattle, sheep, and goats eat the plant.
- Oxybaphus himalaicus*, *Edgew.*; **NYCTAGINÆÆ**. Dry temperate region. This herb is collected for winter fodder.
- Oxytropis microphylla*, *DC.*; **LEGUMINOSÆ**. Alpine region. Sheep and yaks are said to browse on this perennial herb.
- Phaseolus aconitifolius*, *Jacq.*; **LEGUMINOSÆ**. (*VERN. Moth.*) This, as well as *mung* (*P. Mungo*), *urd* (*P. radiatus*), and *P. trilobus*, are cultivated to some extent by the villagers in the warmer regions of the Himálaya, and, as in other parts of India, the leaves, stems, and chaff are available as cattle food.
- Physochlaina præalta*, *Hook. f.*; **SOLANACEÆ**. Dry Alpine region. Used as cattle fodder in Lahoul.
- Picea Morinda*, *Link.* **SYN.—Abies Smithiana, *Forbes*; **CONIFERÆ**. Himálayan Spruce. Temperate region. Affords fodder for sheep and goats.**
- Picrasma quassioides*, *Benn.*; **SINARUBEÆ**. Tropical and temperate regions. The leaves are eaten by sheep and goats.
- Pistacia integerrima*, *Stewart*; **ANACARDIACEÆ**. Tropical and temperate regions. The twigs and leaves are a favourite food of buffaloes and camels.
- Pisum sativum*, *Linn.*; **LEGUMINOSÆ**. The common pea is cultivated on the Western Himálaya up to 13,000 feet; at the higher elevations it does not ripen its seed, and is then used as fodder.
- Polygonum aviculare*, *Linn.*; **POLYGONACEÆ**. Temperate region. Sheep and goats are said to fatten when fed on this plant.
- P. chinense*, *Linn.* Tropical and temperate regions. Cattle are fond of this species. Many other kinds of *Polygonum* are found at various elevations on the Himálaya, and are used more or less as fodder.
- Populus balsamifera*, *Linn.*; **SALICINÆÆ**. Inner ranges of Western Himálaya. The branches are often lopped for cattle fodder.
- P. ciliata*, *Wall.* Temperate region. Affords fodder for goats.
- P. nigra*, *Linn.* (*Lombardy Poplar*.) Is cultivated in the temperate regions of the Western Himálaya, and the branches are often lopped for cattle fodder.

HIMALAYAN
FODDER
PLANTS.

- Trifolium pratense*, *Linn.* Temperate region. Well known in Europe as Red or Broad Clover. It grows wild on the Himálaya and is occasionally collected for fodder.
- T. repens*, *Linn.* Dutch or White Clover. Temperate and Alpine regions. An essential constituent of every good pasture in Europe. It is plentiful on the Himálaya as a wild plant.
- Tulipa stellata*, *Hook.*; *LILIACEÆ*. Tropical and temperate regions. The bulbs are eaten by cattle.
- Ulmus Wallichiana*, *Planch.*; *URTICACEÆ*. Temperate region. Lopped extensively for cattle fodder.
- Vicia hirsuta*, *Koch.*; *LEGUMINOSÆ*. Tropical and temperate regions. Occasionally cultivated as a fodder plant under the name of *masur chana* up to 5,000 feet in Kumáun. Cattle and goats eat it.
- Vigna Catjang*, *Endl.*; *LEGUMINOSÆ*. A variety called *Lobiya-riáns* is cultivated in the tropical region and affords fodder for cattle.
- V. vexillata*, *Benth.* Temperate region. Cattle and goats eat this plant.
- Wendlandia exserta*, *DC.*; *RUBIACEÆ*. Tropical region. Cattle eat the leaves.
- Woodfordia floribunda*, *Salisb.*; *LYTHRACEÆ*. Tropical region. Cattle and goats eat the leaves.
- Wrightia tomentosa*, *R. & S.*; *APOCYNACEÆ*. Tropical region. The leaves are eaten by cattle.
- Xanthium strumarium*, *Linn.*; *COMPOSITÆ*. Tropical region. A common weed of cultivated ground. Probably introduced from America, where it is said that cattle eat the young plants.
- Zizyphus oxyphylla*, *Edgew.*; *RHAMNÆÆ*. Tropical and temperate regions. Goats are fond of the leaves.
- Z. xylopyra*, *Willd.* Tropical region. The young shoots, leaves, and fruit are eaten by cattle and goats.

IV. HIMÁLAYAN GRASSES.

The gradual changes which determine the character of the Flora at different altitudes on the Himálayan Ranges is well exemplified in the case of grasses. As we ascend from the plains, the sub-tropical forms are gradually lost sight of, other species and genera taking their place. On reaching an elevation of about 7,000 or 8,000 feet, the majority of the species are found to be characteristic of a temperate climate, many European genera, such as *Avena*, *Brachypodium*, *Bromus*, *Dactylis*, and *Festuca*, being represented. At still higher elevations, and up to the limit of melting snow, we meet with many species identically the same as occur on the mountains of Europe and America and along the shores of countries within the Arctic region.

Although very little is known concerning the nutritive value of Himálayan fodder grasses individually, it is, nevertheless, certain that excellent pasturage is obtainable at every elevation during certain seasons of the year. The wide open stretches of grass land (maidáns) extending from the upper limits of the forests towards the snow line constitute the finest feeding grounds for cattle and sheep during the summer months. Many of the grasses which flourish in these elevated meadows are known to be highly prized constituents of the best European pastures, and with them are found many allied species which analysis would no doubt prove to be equally valuable.

A.—The following is a list of the more important plains or sub-tropical fodder-yielding species which are found at various elevations approaching the temperate region:—
Andropogon annulatus, *Forsk.*

Strawberries.	(J. Murray)	FRAGARIA vesca.
---------------	-------------	--------------------

III, 744; *Syn. Dist.*, 1
V (Proc.), 5
(App.), 83

Habitat.—Himalayas

Kashmir, altitude 5,000 feet (*Hooker*); 6,000 to 10,000 feet in Manipur, also found in the Ruby Mines and Bhamo districts of the natives of India till its cultivation by Europeans. It is significant treats in the utmost detail Akbar, in India, Kashmir, & strawberry.

Dr. Stewart says that the fruit of the Himalayan plant is excellent when gathered dry, and improves by cultivation. It is one of the most wholesome of fruits.

CULTIVATION.

CULTIVATION.

HISTORY OF.—Since the first introduction of the cultivation of the strawberry into India, the plant has spread in the most remarkable way in the Himalayas from Dacca to the south to Dacca, on the north to the south to Dacca.

History
683

stands remarkably well the great heat of the hot weather, and produces fruit abundantly and of very good quality from February to May, the season of ripening varying in different parts. The *Madras Manual of Administration* (II, 27, 85, 124) reports *F. vesca* as thriving fairly well on parts of the Western Ghats, and in the Shevaroyes. In Lower Bengal, and the plains of Madras and Bombay, on the other hand, the plant does not thrive; it is seemingly unable to withstand the moist heat of those provinces.

The earliest obtainable record of successful cultivation in the plains is one in the *Trans. Agr. Hort. Soc.* (I, 21) by Dr. Tytler, in which he refers to the plant as growing to perfection on the banks of the Jumna near Allahabad. It is not, however, definitely mentioned whether the plants alluded to were English stock or the indigenous *F. vesca*, but subsequent

Method of,
684

**FRAXINUS
excelsior.**

Strawberries ; the Common Ash.

**CULTIVA-
TION.**

established they will perhaps begin to send out runners. Then it would be well to remove, though some persons are of opinion that the doing so causes a larger development of leaves than is favourable to the productiveness of the plant. By February they will have become good large plants, and may be expected then to be in full blossom."

The strawberry may be propagated either by seed or by rooted runners, but varieties can only be obtained from sports in seedlings or by hybridization.

Regarding its cultivation in Bombay, the Director of Land Records and Agriculture has furnished the following report, dated September 1889:—"Though it is much met with in gardens above the Ghâts it can only be successfully grown on the two hill stations of Mahábleshwar and Panchgani, where the fruit develops to a good size. The climate of the plains does not seem to agree with the plant. In Gondal and Kathiawár the plant was twice or thrice tried without success. Towards the end of 1887 about 2,000 strawberry plants were sent from Saharanpur to Mahábleshwar and were distributed amongst cultivators. The plants have taken kindly to the soil, and the plantations are in a flourishing condition. The cultivation of the strawberry has not, however, gone as yet beyond the experimental stage."

The history of the ready adaptability of *F. vesca* to the intense dry heat of the plains of Behar, the Central Provinces, and Upper India, and of the greatly increasing production of the fruit, encourages the hope that the cultivation of the strawberry, in the vicinity of hill stations, and of towns in the plains of which the climatic conditions are favourable, may become a large branch of market gardening. The outturn on even a very small area is very great in comparison to the outlay of money required; but the crop is one that absolutely demands a great deal of attention. It is said that in the Bombay Dekkan, where the plant is peculiarly difficult to grow, a bed of a few square yards will bring in from £15 to £20 the season.

It also appears probable, when one considers the history of the cultivated strawberry in Europe, that a judicious system of crossing the indigenous *F. vesca* with European stock, or with the fine large *F. nilgerensis*, might produce varieties of fruit in no way inferior to those obtained in Europe.

The success that has already attended the efforts of private and market gardeners in many parts of the country, perhaps especially in the large strawberry gardens at Siri near Simla, ought to encourage similar endeavours on the part of Natives near other large centres of demand.

The Common Ash

(J. Murray)

FRAXINUS
excelsior.

Habitat — A large tree of the temperate West Himalaya and Western Tibet from 4,000 to 9,000 feet, distributed from the Caucasus westward

Jhelam, Chenab and Ravi rivers,

(page 193), gives the following description of the propagation and cultivation of the Ash in England —

It is propagated by seeds and varieties are extended by grafting and budding on plants of the same species. The seeds are enclosed in what are termed 'samaras,' or keys, which are generally ripe for gather-

CULTIVA-
TION
686

would be injured. In the
should be sown in rows
ulverised soil. They are
if not sown thin — say

one seed to every three square inches, and the covering of earth should not exceed $\frac{1}{2}$ inch. In the following spring the plants will be ready for being transplanted into the nursery rows, which may be 15 inches from one another, and 4 inches plant from plant in the rows.

"When the plants have stood two years in the nursery rows they may be removed into the forest ground, but if wanted of a larger size they may be left a year longer.

"The ash is in all respects a hardy tree and accommodates itself to most soils and situations not too high lying and exposed, but to grow it to large dimensions of timber, and to have that of good quality, the tree must be planted in a rather low-lying situation and on a strong loamy soil, but not a retentive one, nor on one wet in the sub soil. There is no situation so well fitted for the profitable growth of the ash as the sides of ravines having a good strong loamy soil, where there is a constant supply of water for the roots from the ground above."

Brandis says that the tree requires much light, and that, like the teak, it grows best in a mixed forest.

Medicine — A small quantity of saccharine matter exudes on incision.

Habitat.—A large deciduous tree of the Himalaya, from the Indus to Sikkim, between 5,000 and 8,500 feet.

Medicine.—A concrete, saccharine exudation (manna) is obtained from the stem, by incision, and is employed as a substitute for the officinal manna.

The sugar contained in this exudation, called mannite, differs from cane and grape sugar in not being readily fermentable; though under certain conditions it does ferment, yielding a quantity of alcohol varying from 13 to 33 per cent. (*Dr. Warden*). Like the officinal manna, this is used for its sweetening and slightly laxative properties.

Structure of the Wood.—White, with a light-red tinge, no heartwood, soft to moderately hard. Weight 48lb per cubic foot. It is very similar in structure to the wood of the European ash, from which, however, it differs in having no heartwood.

It is very valuable, possessing most of the qualities of European ash, and is used for oars, jampan poles, ploughs, platters, spinning-wheels, and other purposes.

The Conservator of Forests, Panjáb, writes: "In 1879 samples were supplied to the Timber Ordnance Agent, Fatehgarh, for sponge staves."

F. ornus, Linn.; *DC., Prodr.*, VIII., 274.

THE FLOWERING ASH.

Syn.—*ORNUS EUROPEA*, Pers.

This, though not an Indian species, may be briefly considered, as it is the principal source of the drug known officinally in Europe as "Manna." *F. rotundifolia* and *F. excelsior* are, however, to a smaller extent also manna-yielding ashes.

Habitat.—A small tree of the mountains of South Europe and Asia Minor, extending in the Mediterranean region westwards to Corsica and Eastern Spain.

Medicine.—The name MANNA is applied to the saccharine exudation obtained, by incision, from this tree as well as to other substances. Originally the name was applied to the miraculous food provided for the Israelites during their journey from Egypt, but since then it has come to be used for most saccharine exudations. The officinal manna of European medicine is the production of the three species of ash above mentioned, principally of *F. ornus*, and is frequently known from that circumstance as Calabrian manna. It appears that the manna of Indian medi-

Habitat.—A small tree, or more often a shrub, met with in Afghánistán, the Trans-Indus, and from the Jhelum to Kumaon in the North-West Provinces (Gamble). Aitchison in his *Kuram Valley Flora* mentions it as being found on the ascent to Péwar Kotal, and occasionally all over the Hariab district to Drékalla and Kárátigah. Brandis gives its distribution as the North-Western Himálaya from Kashmir to Kumaon, between 3,000 and 9,000 feet, and Lace mentions the shrub as growing near Quetta.

TIMBER.

701

Structure of the Wood.—A good elastic wood of small size, suitable for staves, jampan poles, walking-sticks, and employed for making ploughs in Kághán (Baden Powell). Used for agricultural implements (Luce, Quetta).

FODDER.

702

Fodder.—Dr. Stewart says its leaves are used as fodder, and Mr. Lace writes that in Southern Afghanistan the tree is never allowed to attain full size, owing to its young branches being continually lopped and the leaves given to sheep and goats, which are very fond of them.

FROGS.

Vern.—Renak, HIND; Bheng, BENG.

Amphibians of the sub-class BATRACHIA and order ANURA, of which they constitute the family RANIDÆ. They occur very commonly in all parts of India, and are especially noticeable during the rains, when their deafening croaking resounds on all sides. Several species are peculiar to definite localities, and many are characterised by the peculiar sounds they produce. Amongst these one may be noticed, an inhabitant of the Khasia Hills, which has a croak so exactly similar to the tinkling of a hammer on an anvil, that even some of the most accurate observers appear to have been deceived by it (*Him. Journ.*, II., 295). But perhaps the most amusing record of frogs in Indian literature occurs in the *Ain-i-Akbari*, the writer of which remarks: "Frogs also may be trained to catch sparrows. This looks very funny." Adams, in his *Wanderings of a Naturalist in India*, mentions that at Poona having shot a sun-bird which fell on the margin of a pool, he saw it seized and devoured by a large green frog. This lends a certain support to the somewhat extraordinary statement made by Abul Fazl. Mr. Edgar Thurston, the Superintendent of the Central Museum, Madras, in a recent exhaustive monograph on the Batrachia, Salientia, and Apoda of Southern India, has described six genera as natives of that region and Ceylon; viz., 1, *Rana*; 2, *Rhacophorus*; 3, *Ixalus*; 4, *Nyctibatrachus*; 5, *Nannobatrachus*; and 6, *Nannophrys*; of which the first comprises 19; the second 14; the third 19; the fourth 2; the fifth 1; and the sixth 2 species. Scientific information regarding the occurrence and distribution of the species of

FRUIT-YIELDING PLANTS.

* *Ananas sativa*, Linn.; THE PINE-APPLE. BROMELIACEÆ.

There are many forms of this fruit, and these improve in quality on passing eastward. They are fairly good in Bengal, but are excellent in Burma and the Malaya, where the plant seems to have become completely naturalised. Abul Fazl (in the *Ain-i-Akbari*, p. 68) alludes to the pine-apple calling it *Kut'hul-i-Safâri* or the Jack fruit of travellers. And in the *Tûsuk-i-Jahân-pîrî* it is stated that the pine-apples at the time of Akbar's son came from the harbour towns of the Portuguese.

FRUITS.

The Chief Fruits of India.

FRUIT-YIELDING PLANTS.

Pyrus Malus, Linn.; THE APPLE.

On the North-West Himálaya there are many forms of this fruit, some admittedly of modern introduction, and others, by Brandis, &c., spoken of as "apparently wild." The Afghan apple is a peculiar oblong fruit with pink marblings and wooly flavour. This is met with in many parts of the Western Himálaya, often becoming less than an inch in length, while preserving all its other characters. A flattened dark-green apple, which when ripe colours faintly on one side, is also frequent on the Himálaya occurring in the gardens of the poorest peasants, and forming a neglected shrub of enclosures. It is probable that these forms represent the so-called wild fruit, but the writer would be much more disposed to accept the round pear as indigenous, than to admit any of the apples as such. A small yellow pippin is common in Delhi, Saharanpur, and other Panjáb plains stations. It comes into season about April and May. At Kullu and also near Simla, large orchards have recently been established where apples, almost equal to the best produced in Europe, may now be purchased. The credit of having developed this new industry is mainly due to Sir E. C. Buck.

P. Pashia, Ham.

This indigenous plant (cultivated in Kullu and elsewhere on the Himálaya) yields a fruit which is edible on falling from the tree in an over-ripe state. (See Fungoid Pests, p. 457.)

**FRAXINUS
excelsior.****Strawberries ; the Common Ash.****CULTIVA-
TION.**

established they will perhaps begin to send out runners. Then it would be well to remove, though some persons are of opinion that the doing so causes a larger development of leaves than is favourable to the productiveness of the plant. By February they will have become good large plants, and may be expected then to be in full blossom."

The strawberry may be propagated either by seed or by rooted runners, but varieties can only be obtained from sports in seedlings or by hybridization.

Regarding its cultivation in Bombay, the Director of Land Records and Agriculture has furnished the following report, dated September 1889:—"Though it is much met with in gardens above the Ghâts it can only be successfully grown on the two hill stations of Mahábleshwar and Panchgani, where the fruit develops to a good size. The climate of the plains does not seem to agree with the plant. In Gondal and Kathiawár the plant was twice or thrice tried without success. Towards the end of 1887 about 2,000 strawberry plants were sent from Saharanpur to Mahábleshwar and were distributed amongst cultivators. The plants have taken kindly to the soil, and the plantations are in a flourishing condition. The cultivation of the strawberry has not, however, gone as yet beyond the experimental stage."

The history of the ready adaptability of *F. vesca* to the intense dry heat of the plains of Behar, the Central Provinces, and Upper India, and of the greatly increasing production of the fruit, encourages the hope that the cultivation of the strawberry, in the vicinity of hill stations, and of towns in the plains of which the climatic conditions are favourable, may become a large branch of market gardening. The outturn on even a very small area is very great in comparison to the outlay of money required; but the crop is one that absolutely demands a great deal of attention. It is said that in the Bombay Dekkan, where the plant is peculiarly difficult to grow, a bed of a few square yards will bring in from £15 to £20 the season.

It also appears probable, when one considers the history of the cultivated strawberry in Europe, that a judicious system of crossing the indigenous *F. vesca* with European stock, or with the fine large *F. nilgerrensis*, might produce varieties of fruit in no way inferior to those obtained in Europe.

The success that has already attended the efforts of private and market gardeners in many parts of the country, perhaps especially in the large strawberry gardens at Siri near Simla, ought to encourage similar endeavours on the part of Natives near other large centres of demand.

F. 685

The Common Ash

(F. Murray)

FRAXINUS
excelsior.

Habitat.—A large tree of the temperate West Himalaya and Western Tibet from 4,000 to 9,000 feet, distributed from the Caucasus westward to Britain (*Fl Br Ind*)

According to Brandis "Basin of the Jhelam, Chenab and Ravi rivers, between 4,000 and 6,000 feet"

Cultivation.—Brown, in his *Forester* (page 193), gives the following description of the propagation and cultivation of the Ash in England —

"It is propagated by seeds, and varieties are extended by grafting and budding on what are termed

CULTIVA-
TION
686

seeds and sand should be turned over every three months. The mass

sure to come up thickly and injure one another. One seed to every three square inches, and the covering of earth should not exceed $\frac{1}{2}$ inch. In the following spring the plants will be ready for being transplanted into the nursery rows which may be 15 inches from one another, and 4 inches plant from plant in the rows

"When the plants have stood two years in the nursery rows they may be removed into the forest ground, but if wanted of a larger size they may be left a year longer

"The ash is in all respects a hardy tree and accommodates itself to most soils and situations not too high lying and exposed, but to grow it to large dimensions of timber, and to have that of good quality, the tree must be planted in a rather low-lying situation and on a strong loamy soil, but not a retentive one, nor on one wet in the sub soil. There is no situation so well fitted for the profitable growth of the ash as the sides of ravines having a good strong loamy soil where there is a constant

Habitat.—A large deciduous tree of the Himälaya, from the Indus to Sikkim, between 5,000 and 8,500 feet.

Medicine.—A concrete, saccharine exudation (manna) is obtained from the stem, by incision, and is employed as a substitute for the officinal manna.

The sugar contained in this exudation, called mannite, differs from cane and grape sugar in not being readily fermentable; though under certain conditions it does ferment, yielding a quantity of alcohol varying from 13 to 33 per cent. (*Dr. Warden*). Like the officinal manna, this is used for its sweetening and slightly laxative properties.

Structure of the Wood.—White, with a light-red tinge, no heartwood, soft to moderately hard. Weight 48 lb per cubic foot. It is very similar in structure to the wood of the European ash, from which, however, it differs in having no heartwood.

It is very valuable, possessing most of the qualities of European ash, and is used for oars, jampan poles, ploughs, platters, spinning-wheels, and other purposes.

The Conservator of Forests, Panjáb, writes: "In 1879 samples were supplied to the Timber Ordnance Agent, Fattehgarh, for sponge staves."

F. ornus, Linn.; *DC., Prodr.*, VIII., 274.

THE FLOWERING ASH.

Syn.—ORNUS EUROPEA, Pers.

This, though not an Indian species, may be briefly considered, as it is the principal source of the drug known officinally in Europe as "Manna." *F. rotundifolia* and *F. excelsior* are, however, to a smaller extent also manna-yielding ashes.

Vern.—*Shir-khist*, HIND.; *Shir-khist*, DEC.; *Ménd, TAM.*, TEL.; *Manna*, MALAY; *Mann, shir-khist*, ARAB.; *Shir khish*, PERS.

References.—*Pharm. Ind.*, 136; *Ainslie, Mat. Ind.*, I., 208; *O'Shaughnessy, Beng. Dispens.*, 433; *Fick, and Hand., Pharmacog.*, 409; *Irvine, Nat. Med., Patna*, 101; *Birdwood, Berb. Pr.*, 52; *Smith, Dic.*, 25; *Kew O. Guide to the Mus. of Et. Bot.*, 94.

Habitat.—A small tree of the mountains of South Europe and Asia Minor, extending in the Mediterranean region westwards to Corsica and Eastern Spain.

Medicine.—The name MANNA is applied to the saccharine exudation obtained, by incision, from this tree as well as to other substances. Originally the name was applied to the miraculous food provided for the Israelites during their journey from Egypt, but since then it has come to be used for most saccharine exudations. The officinal manna of European medicine is the production of the three species of ash above mentioned, principally of *F. ornus*, and is frequently known from that circumstance as Calabrian manna. It appears that the manna of Indian medi-

cine is derived from a wholly different source. The true *shir-khist* of the bazars of North-Western India is imported from Afghanistan, Turkestan, and Persia, and is probably the exudation of *Cotoneaster nummularia*, and to a lesser extent of *Araphaxis spinosa*. Flückiger and Hanbury have examined fragments of this *shir-khist* and pronounce it to be indisputably derived from *Cotoneaster*. They write "It is in irregular roundish tears, from about $\frac{1}{4}$ up to $\frac{3}{4}$ inch in greatest length of an

MEDICINE
Imported
manna.
698

There is however, a certain amount of manna obtained in India from

Indigenous
manna.
699

at present investigated. Dr Dymock to whom a specimen has samples have been sent has obligingly drawn the writer's attention to an interesting passage in the *Makhsan-el-Ad*.

Shir-khist writes, "and they say Behar, Patna, and Bháulpur, a from a plant, called, in Hindi, manner the tree is cut down a causes a flow of boiling juice which sugar sweetmeats, and this sugar has all the properties of the *shir-khist*. *Harialu* Hakim Mir Muhammad Abdul Hamid writes, 'I have myself used it as *Shir-khist*'."

The manna alluded to in the above passage cannot possibly be the substance obtained from the Central Provinces, which is evidently a natural exudation, which, falling in a shower, incrustates leaves, twigs, manna from the tips of the twigs which, cementing the needles into clotted masses, and melting through the heat of the sun, has encrusted

adulterating honey

* Dymock reports that it does not appear to agree with any known manna. It, however, contains glucose and a crystalline sugar like mannite.

† *Rhododendron arboreum* has since been observed to be exuding manna as a result of Aphides.

FROGS.

The Ash; Frogs.

700

Dr. Ainslie writes: "The Hindus know and care little about manna; the Muhammadans of India prescribe it as a laxative to children and delicate women, in doses from $\frac{3}{2}$ to $\frac{3}{4}$; and the Arabians give it a place amongst their *Mushilat-sufra* (cholagogues)."

Fraxinus xanthoxylodes, Wall.; *Fl. Br. Ind.*, III., 606.

Syn.—F. MOORCROFTIANA, Brand.; ORNUS XANTHOXYLOIDES, G. Don.

Vern.—*Auga, gaha*, N.-W. P.; *Hanus, nuch, shilli, chuj, thum, shangal, kanóch, hanóch*, Pb.; *Shang, hagai*, PUNJUB.

References.—Brandis, *For. Fl.*, 304; Gamble, *Man. Timb.*, 256; Stewart, *Pb. Pl.*, 139; Atkinson's *Flora of the Kuram Valley*, 79; Baden Powell, *Pb. Pr.*, 581; Balfour, *Cyclop.*, I., 1151; Indian Forester, V., 185, 478; *Rawalpindi Gazetteer*, 15; *Simla Gazetteer*, 11.

Habitat.—A small tree, or more often a shrub, met with in Afghanistan, the Trans-Indus, and from the Jhelum to Kumaon in the North-West Provinces (Gamble). Aitchison in his *Kuram Valley Flora* mentions it as being found on the ascent to Péwar Kotal, and occasionally all over the Hariab district to Drékalla and Kárátigah. Brandis gives its distribution as the North-Western Himálaya from Kashmir to Kumaon, between 3,000 and 9,000 feet, and Lace mentions the shrub as growing near Quetta.

Structure of the Wood.—A good elastic wood of small size, suitable for staves, jampan poles, walking-sticks, and employed for making ploughs in Kághán (Baden Powell). Used for agricultural implements (Luce, *Quetta*).

Fodder.—Dr. Stewart says its leaves are used as fodder, and Mr. Lace writes that in Southern Afghanistan the tree is never allowed to attain full size, owing to its young branches being continually lopped and the leaves given to sheep and goats, which are very fond of them.

FROGS.

Vern.—*Renak*, HIND; *Bheng*, BENG.

Amphibians of the sub-class BATRACHIA and order ANURA, of which they constitute the family RANIDÆ. They occur very commonly in all parts of India, and are especially noticeable during the rains, when their deafening croaking resounds on all sides. Several species are peculiar to definite localities, and many are characterised by the peculiar sounds they produce. Amongst these one may be noticed, an inhabitant of the Khasia Hills, which has a croak so exactly similar to the tinkling of a hammer on an anvil, that even some of the most accurate observers appear to have been deceived by it (*Him. Journ.*, II., 295). But perhaps the most amusing record of frogs in Indian literature occurs in the *Ain-i-Akbari*, the writer of which remarks: "Frogs also may be trained to catch sparrows. This looks very funny." Adams, in his *Wanderings of a Naturalist in India*, mentions that at Poona having shot a sun-bird which fell on the margin of a pool, he saw it seized and devoured by a large green frog. This lends a certain support to the somewhat extraordinary statement made by Abul Fazl. Mr. Edgar Thurston, the Superintendent of the Central Museum, Madras, in a recent exhaustive monograph on the Batrachia, Salientia, and Apoda of Southern India, has described six genera as natives of that region and Ceylon; viz., 1, Rana; 2, Rhacophorus; 3, Ixalus; 4, Nyctibatrachus; 5, Nannobatrachus; and 6, Nannophrys; of which the first comprises 19; the second 14; the third 19; the fourth 2; the fifth 1; and the sixth 2 species. Scientific information regarding the occurrence and distribution of the species of

FRUITS.

The Chief Fruits of India.

FRUIT-YIELDING PLANTS.

Mangifera foetida, Lour.; ANACARDIACEÆ.

M. indica, Linn. THE MANGO TREE.

The number of cultivated and distinct forms of this fruit are probably as great as that of the European apple.

M. sylvatica, Roxb. THE WILD MANGO.

Mimusops hexandra, Roxb.; THE KHIRNI. SAPOTACEÆ.

Cultivated in Western India, especially at Goa, as a fruit. It is said to be agreeable and subacid.

Morus indica, Linn.; THE MULBERRY. URTICACEÆ.

A favourite fruit in many parts of India, but especially so with the hill tribes.

Musa paradisiaca, Linn.; THE PLANTAIN. SCITANINÆÆ.

M. sapientum, Linn. BANANA.

The number of Plantains and Bananas is very great. The reader is referred to the account of them given under *Musa* in another volume. The *chumpa* plantains of Bengal and Burma are perhaps the finest in flavour.

Myrica sapida, Wall.; THE KAPHUL. MYRICACEÆ.

A fruit of the Lower Himálaya and the Khasia Hills; ripening about May. Though largely eaten by the hill tribes the tree does not appear to be cultivated.

* *Nephelium Litchi*, Camb.; THE LITCHI. SAPINDACEÆ.

This tree is supposed to have been recently introduced into India from China. There are various forms, differing in thickness and flavour of pulp. The fruit comes into season in April and May. It succeeds best in the hot damp areas, such as in Bengal.

N. Longana, Camb. THE LONGAN FRUIT.

This fruit, which ripens about the end of June, is in Calcutta about the size and form of a marble, borne in great branches like grapes. The fleshy aril is, as in the Litchi, the edible portion.

* *Olea europæa*, Linn.; THE OLIVE. OLEACEÆ.

* *Opuntia Dillenii*, Haw.; THE PRICKLY PEAR. CACTEÆ.

* *Passiflora*; PASSIFLOREÆ.

Several species of Passion-flower yield edible fruits—the GRANA-DILLA fruit—especially *P. quadrangularis*, *P. laurifolia*, and *P. edulis*. Though several species flower profusely on the Himálaya, none appear to be eaten in India.

* *Phoenix dactylifera*, Linn.; THE DATE PALM. PALMÆ.

P. sylvestris, Roxb. THE WILD DATE.

Phyllanthus Emblica, Linn.; THE EMBLIC MYROBALAN. EUPHORBIACEÆ.

Yields a useful fruit in the cold season which is pickled and made into jelly.

P. distichus, Muell.; THE OTAHEITE GOOSEBERRY.

Yields a fruit which, when cooked with sugar, greatly resembles green gooseberries. It is a native of India, though only rarely met with in cultivation.

* *Physalis peruviana*, Linn.; THE CAPE GOOSEBEERY or TIPARÍ. SOLANACEÆ.

Extensively cultivated in the plains of India and eaten in dessert or made into jam and chutney. Become quite acclimatised in some parts of the country.

also common, but, what is perhaps more significant, the green semi-wild fruit of the Himálayas is a *clingstone* fruit, while that of the greater part of the plains and Nilghiri hills is *freestone*

P. Puddum, Roxb

Common in the North-West Himalayas

of China and India

Pyrus baccata, Linn. , THE SIBERIAN CRAB ROSACEÆ

P. communis, Linn. THE COMMON PEAR

The hard round pear of the North-West Himálaya is quite distinct from the modern introduced pyriform fruit, and it is probably an indigenous production. In Kullu and other parts of the Himálaya large, yellow, soft, luscious pears are grown which compare favourably with any of the pears produced in Europe

FUEL.

Fuel and Firewood.

India and the United States. To the natives of India the plant as a medicinal substance is unknown. Its therapeutic properties are very similar to those of iodine, being deobstruent, and considered of specific value in scrofulous affections, rheumatism, and glandular swellings, particularly goitre.

In 1862, Dr. Duchesne Dupare described it as having a marked effect in diminishing obesity, and it is said to be an ingredient in the extensively-advertised nostrum,—“Anti-Fat.” In Europe this plant for a long time formed a considerable source of soda alkalis, but its importance for this purpose has diminished in recent years. Its principal value is now in the manufacture of IODINE and BROMINE, as it with *F. nodosus* forms the greater part of the sea-weed burned to form KELP.

Fodder and Manure.—It is said by Greville to form an article of FODDER and SHEEP FOOD in some of the islands of Scotland. It is also a valuable MANURE.

It is possible that both species of *Fucus* may be found in greater quantity than is generally known along the northern shores of the Indian Ocean, in which case it is well to remember their important economic properties.

FUEL & FIREWOOD.

With very few exceptions all the timber trees of India might be used as firewood. Certain timbers, however, emit an objectionable odour, and on that account are rarely used; others are too valuable. The heat-giving property is a point of great importance in fuel-supply, and it seems probable that a thorough investigation of the heat evolved from given weights of timber would greatly narrow the list of plants which should be enumerated as suitable for steam purposes, whether railway or machinery.

FULLER'S EARTH; *Ball.*; *In. Man. Geol. of India, Vol. III., 570.*

The following brief note on this subject has been obligingly furnished by Mr. H. B. Medlicott for this work:—

Fuller's earth.

TERRE À FOULON, Fr.; *WALKERERDE, Ger.*; *CRETA DA SODARE I PANNI, Ital*

717

Range: the so-called *alutians-mitti* imported into Persia in various qualities:—

- (1) White mitti, called "*khajrū*," or edible, from Bikanir and Jessalmir;
- (2) Yellow mitti, or "*bhakra*," for dyeing cloths, from the same localities;
- (3) Light green or "*sabun mitti*," for cleaning the hair, from Vadur in the Dera Ghazi Khan district.

718

719

720

FUMARIA
parviflora.

The Fumitory.

At Nilawan, in the Salt Range, a lavender-coloured clay or decomposed rock, which is found with volcanic rock at the above locality, is used as fuller's earth by the natives. The reader is referred for further information to the article CLAY (Vol. II., pp. 360—368, but especially paragraph No. 1319 on *Edible and Medicinal Earths*).

Fulwa Butter, see *Bassia butyracea*, Roxb.; Vol. I., 405.

FUMARIA, Linn.; Gen. Pl., I., 56, 965.

A genus which belongs to the Natural Order FUMARIACEÆ, having about eight species; usually weeds of cultivation in the temperate regions of the Old World. Only one of these is indigenous to India, namely, *F. parviflora*, but *F. officinalis*, Linn., may be also briefly considered, as it yields the true Fumitory and is employed in Native medicine.

721

Fumaria officinalis, Linn.; FUMARIACEÆ.

Vern.—*Pit-piparā*, HIND.; *Shātrā*, DEK.; *Turn*, TAM.; *Chata-rashi*, TEL.; *Baglatul mulk*, *shateraj*, ARAB.; *Shāhtara*, PERS.

References.—*Pharmacographia Indica*, I., 114; *Ainslie, Mat. Ind.*, I., 138; *O'Shaughnessy, Beng. Dispens.*, 184; *Moodeen Sheriff, Supp. Pharm. Ind.*, 273; *Dymock, Mat. Med. W. Ind.*, 52.

Habitat.—A weed of cultivation in Persia. Two varieties of Fumitory are described in the *Makhran-el-Adwiyā*, one with violet coloured flowers, and the other and larger kind with white flowers.

F. officinalis was mentioned by Dr. Stewart in 1859 as occurring as a field weed near Abbottabad, but it is probable that the plant he collected was really *F. parviflora*, since *F. officinalis* has not been found by other botanists in India.

MEDICINE.
Fumitory.

722

Medicine.—The entire plant except the root is used medicinally, constituting FUMITORY which has long been known, and was highly esteemed by the Greeks and Romans. It is, however, not now employed by European practitioners, and is not to be found in the Pharmacopœia of England, America, or India, although still much used in this country by native practitioners. The fumitory sold in Bombay is this species (*Dymock*), and is imported from Persia, while in Upper India the indigenous plant is substituted.

The vernacular terms are used indiscriminately, and as the medicinal properties are similar, the uses of both species may be detailed in the account of the Indian plant.

723

F. parviflora, Lamk.; *Fl. Br. Ind.*, I., 128.

Vern.—*Pitpapara* (*Pitpāpra*), HIND.; *Ban-sulpha*, BENG.; *Shāhtara*, *pit-papra*, *pāpra*, PUSHTU; *Shatra*, SIND; *Pitpāpra*, BOMB.; *Pitpapā*, GUZ.; *Pitpapara*, *shātrā*, DEC.; *Turā*, TAM.; *Chūta-rāshi*, TEL.; *Buks-lat-ul-mulik*, *baglatul-mulk*, ARAB.; *Shatra*, *shāhtarah*, PERS.

References.—*Roxb., Fl. Ind.*, Ed. C.B.C., 531; *Stewart, Pb. Pl.*, 11; *Pharmacographia Indica*, I., 115; *O'Shaughnessy, Beng. Dispens.*, 184; *Moodeen Sheriff, Supp. Pharm. Dist.*, 737; *Birdwood, Bomb. Pr.*, 7; *Aitchison, Afgh. Del. Com. Rep.*, 128; *Balfour, Cyclop.*, I., 1155; *Bomb. Gaz.*, VI., 14; *Raj. Gaz.*, 30.

Habitat.—Found in rice-fields during the cold season; in the Indo-gangetic plain, Lower Hímálāya (up to 8,000 feet), and Nilghiri hills. It is described by Dr. Aitchison as generally distributed over the whole of Afghánistán.

MEDICINE.

724

Medicine.—Fumitory has long been regarded as laxative, diuretic, alterative, tonic, diaphoretic, and febrifuge. It has consequently been

F. 724

Fungi and Fungoid Pests.

(J. Murray.)

FUNG1, &c

much used by native practitioners in India, and is still highly esteemed by the Muhammadans. It is, however, very little used by European practitioners, and its value has probably been overestimated by the natives.

FUNG1 AND FUNG0ID PESTS.

725

The FUNGI of India are very numerous, and comprise many species of economic interest. Several are used as food, others as medicine, while certain microscopic forms are of importance, since they produce the rusts, moulds, smuts, and other pests which infest many of our crops, fruits, and timber trees. The writer is much indebted to Dr. Barclay for having kindly revised the following brief article.

V

References —Stewart, *Pb Pl*, 267, Barclay's *Descriptive List of the*

MEDICINE.
726

able anthelmintic

which occurs in the nests of white-ants, is also supposed to possess medicinal virtues (Balfour).

FOOD.
727

other forms widely used as food by certain classes of natives in India,

FUNG1, &c.

Fungi and Fungoid Pests.

FOOD.

another species as being freely eaten in the Panjáb, which is known as *shirton* in the Jhelam, and *bat-bakri* in the Kair valley. He describes it as "a thin, flat, ragged-looking Fungus, yellow above and with white gills below, which is got on dead trees in various parts of the Panjáb Himálaya at 8,000 to 8,500 feet. The natives slice and cook it either fresh or dry, and eat it as a relish with bread. I have tried this species in stews, &c., but found it leathery and flavourless."

The same author also mentions an "underground mushroom" of doubtful species, found in cultivated ground near Multan and known as *boin-phul* in the vernacular. This, he says, is also eaten by the natives.

Balfour in his "*Agricultural Pests of India*," p. 61, describes an underground fungus, *Mylitta*, as occurring in the Nilgiri hills, and considers it probably closely allied to the so-called native-bread of Tasmania; but gives no record of its being eaten by the natives.

Ferments.—Some of the microscopic forms seem to be useful as substitutes for yeast (see *Cerevisiæ Fermentum*, Vol. II., 257).

Fungoid Pests, the characters of which can generally be made out by the use of the microscope only, are small fungi, which attack and injure the plants or animals on which they are parasitic. Among the more hurtful in India are species of *Æcidium*, *Capundium*, *Chætomium*, *Clarterisporum*, *Diplodia*, *Dothidea*, *Eurotium*, *Glenospora*, *Hemileia*, *Hendersonia*, *Hydnum*, *Isaria*, *Leutinus*, *Pellicularia*, *Pestalozzia*, *Puccinia*, *Russula*, *Septoria*, *Uromyces*, and *Ustilago* (*Balfour's Agricultural Pests of India*). *Chionyphe Carteri*, *Berkeley* (*Nyctetoma* sp. of *H. Vandyke Carter*) is the fungus whose ravages cause the deeply-seated disease known as the MADURA FOOT.

Polyporus anthelminticus, *Berkeley*, grows at the root of old bamboos, and is employed as an anthelmintic in Burma.

Ergot—Is the sclerotoid condition of *Claviceps purpurea* (see Vol. II., 359).

Fungi attacking plants produce an appearance on the leaves, stems, &c., known as MILDEW, MOULD, RUST or SMUT. These small parasites present many features of great interest both to the botanist and agriculturist; but owing to the difficulty of determining their life-histories, little is as yet known regarding them. The following forms, however, are those which are at present recorded as attacking the more important crops and trees of India:—

Peridermium Thomsoni, *Berkeley*, is a fungus found on the *Picea Moriada* of the Himálaya. The leaves under the growth of the parasite become reduced one half in length, curved, and sprinkled, sometimes in double rows, with *Æcidia*. The growth in time proves fatal to its host. Dr. Barclay has recently described three species of URIDINEÆ which attack the same tree in the North-Western Himálaya—two species of *Æcidium* and one of *Chrysomyxa*. One of the *Æcidia* causes general pseudo-hypertrophic distortion of the needles of its host, while the other attacks only the youngest shoots. The first of these may be the same as that described above, but the data given in the description of *Peridermium Thomsoni* are not sufficient to allow of a decision being arrived at. Dr. Barclay, while regretting that he has not had the time nor opportunity to fully work out the life-history of his first species, writes, "A continued study of it is much to be desired, if only from an economic point of view, for the affection must prove very destructive to these valuable timber trees. Apart from the diversion of nutriment it must occasion, the habit it has of attacking new shoots, and so completely involving them as to destroy them must be most injurious to these trees." A similar æcidial parasite has also been found on *Cedrus Libani*, var. *Deodara*, by the same investigator. *Pinus longifolia* and *P. excelsa*, particularly the former,

destructive to the coffee plantations of Ceylon and Southern India		744
<i>Peronospora</i> .—The POTATO crops of Assam have been largely attacked by <i>P. infestans</i> . Dr D D Cunningham has noted the occurrence of <i>P. arborescens</i> as a destructive parasite on the POPPY. It is quite possible that the cause of the destruction of the VINE industry of Basahr was due to <i>P. viticola</i> , but unfortunately there is no sufficient evidence to show what was really the cause of that vine disease. It may very possibly have been due to <i>Oidium</i> (<i>Erysiphe</i>) <i>Tuckeri</i> .		745
Dr D D Cunningham reports the existence of a root blight in the Darjeeling district TEA gardens. The blight was undoubtedly due to a fungus, but the specimens at his disposal did not enable him to determine its nature.		746
<i>Tilletia caries</i> , or BUNT is a fungus which attacks WHEAT and occupies the whole farinaceous portion of the grain. SORGHUM and the SMALL MILLETS are liable to attacks from allied parasites.		Bunt.
<i>Ustilago</i> or SMUT has been described by Dr Cooke as attacking BARLEY and many GRASSES in the Panjab, also the male flowers of the		747
F. 748		Smut.
		748

FURS.

Fur-bearing Animals.

FUNGOID
PESTS.

MAIZE. In 1870, a form of *Ustilago* made its appearance on RICE, and is said to have affected a considerable portion of the crop in the neighbourhood of Diamond Harbour in Bengal. The mycelium of this fungus grows into the tissues of its host, forming a whitish, gummy, interlaced thread-like net, in which the spores form. These become at length a more or less coherent mass, dirty-green on the exterior of the infected grain, but of a bright orange-red colour inside. Dr. Barclay, in a note kindly furnished on this subject, writes, "The SMUT on wheat, barley, and oats in Europe is *Ustilago segetum*, Bull.; and Dr. Brefeld informs me that the Indian species is identical with it. That on Maize is *U. Maydis*, DC."

In concluding these brief notices of Fungoid Pests the hope may be expressed that the present active researches of Dr. Barclay in the Simla District, and of others, into the interesting life-history of these fungi, may clear up many points which are at present very obscure, and so perhaps open a way to fresh exertions in devising methods for the prevention of the destruction effected by these pests.

For further information regarding Fungoid Pests see Coffee, Indigo, Rice, Wheat, &c.

749

FURCRÆA, Vent.; Gen. Pl., III., 739.

An American genus of Amaryllidaceous plants containing some 10 or 15 species. These are closely allied to the Agaves and indeed are commercially viewed as identical, the fibres derived from the two genera being collectively designated American Aloe fibres. *Furcraea gigantea*, the best known fibre-yielding species of this genus, was formerly known as *Agave foetida*, and by some writers *Agave vivipara* is spoken of as *Furcraea Cantala*.

There is very little that need be said here regarding these plants. A few of them are cultivated in India, and these have been experimentally tested for their fibres. In this country, however, their cultivation as sources of fibre has up to this time been very unimportant and insignificant, compared with the degree to which they are utilized in Mauritius. The fibre of *F. gigantea* is, in fact, commercially designated *Mauritius Hemp*. The reader is referred to the article *Agave* in Vol. I., pp. 133--144.

Furniture. See Cabinet Work, Vol. II., I.

GALLS.	The Cod; The Cheese Rennet; Galls.
I	<p style="text-align: center;">GADUS.</p> <p>Gadus morrhua, <i>Linn.</i>; PISCES. THE COMMON COD. The fish from which the official Cod Liver oil is obtained, is not a native of the Indian seas; it abounds on the coasts of Norway, France, Britain, Ireland, and is specially common in the seas along the coast of Newfoundland. The oil extracted from the liver is imported into this country for medicinal purposes. It is a valuable alternative and nutritive tonic, especially beneficial in scrofulous and tuberculous affections, rickets, and other diseases due to impaired nutrition.</p>
	<p>SUBSTITUTES. 2</p>
3	<p>Substitutes.—Several Indian fish yield oil, which is, however, owing to carelessness in methods of manufacture, generally rancid and unfit for medicinal use. Dr. Bidie states that the best of these oils, and one that might be substituted for the official <i>OLEUM MORRHUÆ</i>, is that obtained from the livers of certain species of <i>Carcharias</i>, which abound off the Western Coast. See <i>Carcharias</i>, Vol. II., 155; also <i>Fish</i>, Vol. II., 368-397.</p> <p>Galangal; see <i>Alpinia Galanga</i>, <i>Willd.</i>; Vol. I., p. 192.</p> <p>Galbanum. A gum-resin, probably obtained from two species of <i>Ferula</i>, <i>vis.</i>, <i>F. galbaniflua</i> and <i>F. rubicaulis</i>. See Vol. III., 338.</p> <p>Galena or Sulphide of Lead, see Lead, Vol. IV.</p>
	<p style="text-align: center;">GALIUM, Linn.; Gen. Pl., II., 149.</p>
4	<p>A genus of small, weak herbs of the Natural Order <i>RUBIACEÆ</i>, comprising about 150 species, mostly temperate. Of these 20 are natives of India, and occur chiefly on the Temperate Himalaya.</p>
	<p>Galium verum, <i>Linn.</i>; <i>Fl. Br. Ind.</i>, III., 208; <i>RUBIACEÆ</i>. THE CHEESE RENNET.</p>
<p>DYE. Roots. 5</p>	<p>References.—<i>Boiss.</i>, <i>Fl. Orient.</i>, III., 62; <i>Balfour</i>, <i>Cyclop.</i>, I., 1163; <i>Smith</i>, <i>Dic.</i>, 107; <i>Treasury of Bot.</i>, I., 517.</p> <p>Habitat.—A perennial herb with erect or rambling stems from 1 to 3 feet high, found in the Western Himalaya at altitudes of 5,000 to 10,000 feet.</p> <p>Dye.—<i>Smith</i> mentions that the ROOTS are extensively collected in Europe for the dye which they yield, which is said by him to be equal to madder. Several other species of the genus yield a purple dye, but no mention appears to be made by Indian writers of their utilisation in this country.</p>
<p>DOMESTIC. Plant. 6</p>	<p>Domestic Uses.—The PLANT was formerly extensively employed in Europe as a reagent for curdling milk, from which property it has derived its popular name, but in India the best known vegetable rennet is <i>Withania coagulans</i>.</p>
7	<p>Galium, <i>sp.</i></p>
	<p>An undetermined species of GALIUM, mentioned by Aitchison as very common in the shade of rocks on the low hills near Badghis, in Afghánistan, which was observed by him to dye the hands a yellow-green on collecting it. (<i>Botany of Afgh. Del. Com.</i>, 73.)</p>
8	<p style="text-align: center;">GALLS.</p>
	<p>Galls. By the term gall is commonly understood a deformity or excrescence, due to a parenchymatous hypertrophy of the structure of a plant caused</p> <p style="text-align: center;">G. 8</p>

GAMBIER.

Gambier.

10

This resinous extract is prepared from *Uncaria Gambier*, Roxb, much in the same manner in which Cutch or Catechu is made. The plant is a native of Malacca, Penang, and Singapore, distributed to Java and Sumatra. The extract made up in small (one inch) cubes, is of a pale

G. 10

GARCINIA
Cambogia.

Gambier; The Garcinias

greyish yellow colour, and has a bitter taste. It is largely imported into India to be eaten in *pau*, but the yellow semi-crystalline form of Cutch prepared in Kumaon is to a large extent used for the same purpose, and is even made up in cubes to resemble Gambier. Gambier is an official drug in the British Pharmacopœia, and is known in medicine as pale catechu. In the United States Dispensatory Catechu (*Acacia Catechu*) is official, while Gambier is rejected. In the Indian Pharmacopœia both drugs are official.

A certain re-export trade in Gambier takes place from India, but the official designation (in Trade Returns) of "Cutch and Gambier" should be understood to refer almost exclusively to the dark or Pegu form of Cutch, and to the pale or Kumaon form of so-called Gambier. See *Acacia Catechu*, Vol. I., pp. 29 to 40; also *Uncaria*.

Gamboge, see the various species of *Garcinia*.

GARCINIA, Linn.; *Gen. Pl.*, I., 174.

A genus of trees, usually yielding yellow juice, which belongs to the Natural Order GUTTIFERÆ, and comprises in all some 50 species, which are distributed over Tropical Asia, Africa, and Polynesia. Of these, about 30 are natives of India, and several possess features of considerable economic interest.

II

Garcinia anomala, *Planch. & Trian*; *Fl. Br. Ind.*, I., 266; GUTTI-
[FERÆ.
Syn.—*GARCINIA AFFINIS*, Wall. (in part).

References.—*Kurz*, *For. Fl. Burm.*, I., 89; *Kurz*, *Prelim. For. Rep. on Pegu*, App. A., xii.; *Indian Forester*, IV., 241; XI., 392.

Habitat.—A small erect tree found in the beds of torrents, in the Jaintia Hills and Khasia Mountains, between altitudes of 3,000 and 5,000 feet; also not uncommon in the damp and dry hill forests of Martaban east of Tounghoo at elevations of from 4,000 to 6,000 feet.

Gum-Resin.—The tree yields "an inferior gamboge" (*Kurz*).

Structure of the Wood.—Sapwood white, soft (*Kurz*).

The Gamboge Trees.

27

Garcinia echinocarpa, *Thw. ; Fl. Br. Ind., I., 264.*Vern.—*Madol*, SING.References.—*Beddome, Fl. Sylv., Anal. Gen., xxi. ; Thwaites, En. Ceylon Pl., 49 ; Indian Forester, X., 33.*

Habitat.—A tall tree of the Central and Southern Provinces of Ceylon.

OIL.
Seeds.Oil.—“A thick oil, extracted from the SEEDS, is used by the Singalese for burning in their lamps, but it gives a very indifferent light” (*Thwaites*).

28

29

G. eugenæfolia, *Wall. ; Fl. Br. Ind., I., 268.*

Habitat.—A small tree of the Eastern Peninsula, found in Singapore, by Wallich, and in Malacca, by Griffith.

GUM.

30

Gum-Resin.—Helfer mentions that the stem exudes a green varnish, and Griffith that the juice of the fruit is milky. No further information, in confirmation of these interesting statements, is, however, available.

31

G. heterandra, *Wall. ; Fl. Br. Ind., I., 265.*Syn.—*HEBRADENDRON WALLICHII*, *Chois.* Kurz considers this Burmese species to be identical with the Sylhet specimen, *G. ELLIPTICA*, *Wall.*, and he retains the latter name for both. The *Flora of British India*, however, reduces the Sylhet plant to *G. Morella*, *Desrouss.*, a synonymy that has been here followed. It appears probable, that the information, given by writers on the resources of Burma, regarding the plant they call *G. elliptica*, *Wall.*, really refers to the species at present under consideration, and will, consequently, be detailed in this article.Vern.—*Thanat-tau, tha-nat-dau*, BURM.References.—*Kurz, For. Fl. Burm., I., 92 ; in As. Soc. Jour. Beng., XLIII., pt. II., 87 ; Prelim. Forest Report on Pegu, App. A., xiii. ; Gamble, Man. Timb., 22 ; Mason, Burma and its People, 480-82, 751 ; Jour. Agri.-Hort. Soc. Ind., X. (old series), pro. cxxi. ; Balfour, Cyclop., I., 1175 ; Indian Forester, XI., 393.*

Habitat.—An evergreen tree of the forests of Pegu and Tenasserim, ascending to 4,000 feet.

GUM.

32

Gum-Resin.—Mason, and later, Kurz, have both described this tree as yielding a superior kind of Gamboge, so similar to the Gamboge of commerce that the former writer considered it identical. He wrote, “In its appearance to the eye and in its properties as a pigment, I have failed to discover the slightest difference between the exudation of this tree and the Gamboge of commerce.” It readily forms an emulsion with water.

An interesting account is given, in the Agri-Horticultural Society's Journals, Vol. X. (old series), of an analysis of a gamboge obtained from a tree in Burma, called *Tanatan* (probably a misprint for *Tanatau*, the vernacular name of this species). Mr. D. Hanbury, the analyst, writes, “I find this gum-resin to be, in its chemical characters, precisely like the ordinary Siamese gamboge; it is, however, much mixed with impurities, and is, in fact, but rudely prepared. If carefully collected and cast in bamboos (like the Siam drug), I cannot but think that it would equal the finest gamboge we get.”

DYE.

33

Dye.—Mason states that the Burmese priests occasionally employ the gamboge obtained from this species to dye their robes, and the Karens to colour their thread; and that it serves equally well as a pigment.

MEDICINE.
Gum-resin.

34

Medicine.—The GUM-RESIN is occasionally, though not extensively, employed as a medicine by Burman native practitioners (*Mason*).

Kokam Butter.

CHEMISTRY.

bland oily taste. It melts in the mouth like butter, and leaves a sensation of cold on the tongue. When long kept it is apt to become rancid, and acquires a browner colour, while an efflorescence of shining tufted crystals appears on the surface of the mass. As ordinarily met with, it contains a considerable amount of impurity, chiefly particles of the seed. As above stated, the purest quality is that obtained by the second process (churning). By filtration under the influence of heat it may be obtained perfectly pure, in which condition it is quite transparent, and of a very light yellowish colour, but at lower temperatures it becomes white and crystalline. The butter of commerce melts at about 40°C. Flückiger and Hanbury give the following account of its chemical composition: "Purified kokám butter boiled with caustic soda yields a fine hard soap, which, when decomposed with sulphuric acid, affords a crystalline cake of fatty acids weighing as much as the original fat. The acids were again combined with soda, and the soap having been decomposed, they were dissolved in alcohol of about 91 per cent. By slow cooling and evaporation crystals were first formed, which, when perfectly dried, melted at 69.5°C.: they are consequently Stearic acid. A less considerable amount of crystals, which separated subsequently, had a fusing point of 55°, and may be referred to Myristic acid. A portion of the crude fat was heated with oxide of lead and water and the plumbic compound dried and exhausted with ether, which after evaporation left a very small amount of liquid oil, which we refer to oleic acid." It contains no volatile fatty acid.

HISTORY.
40

HISTORY.—Kokam butter has doubtless been employed by the Natives, of at least South-Western India, since remote times, but it does not appear to have attracted the notice of Europeans till about the year 1830. In 1833 a writer in the *Journal of the Asiatic Society of Bengal*, described its employment medicinally by the Natives and advocated its trial by Europeans. It was adopted as officinal during the compilation of the *Indian Pharmacopœia* in 1868, and is now generally recognised as a solid oil of considerable value.

MEDICINE.
Fruit.
41

Medicine.—The FRUIT has been long employed in South-Western India as a semi-medicinal article of diet. The authors of the *Pharmacographia Indica* state that its virtues were first recognised by the English at the end of the eighteenth century, when it was employed as an anti-scorbutic in the Bombay Army. It is acid, slightly astringent, and is considered by native physicians to be superior to tamarind for the preparation of acidulous drinks. Dymock states that the apothecaries of Goa prepare a very fine red syrup from the juice of the fruit, which they administer in "bilious affections." The OIL or Kokam butter, already described, is considered demulcent, nutrient, and emollient. Moodeen Sheriff, in his forthcoming work on the *Materia Medica* of Madras, writes, "I have used it internally in my practice, and have found that its best medicinal properties are its usefulness in phthisis pulmonalis and some scrofulous diseases, and in dysentery and mucous diarrhoea. In the former, its action is something like that of cod-liver oil, of which it is a pretty good, and very cheap and pleasant, substitute; and in the latter, it is of great service in relieving tormina and tenesmus when employed as an adjuvant to other medicines." He recommends doses of from $\frac{1}{2}$ to 1 ounce as a nutritive tonic in place of cod-liver oil, and 1 to 2 drachms as an emollient adjuvant to other drugs in dysentery and mucous diarrhoea. It is employed externally by the natives as a remedy for excoriations, chaps, fissures of the lips, &c., by partly melting it and rubbing the affected part. It was introduced into the *Pharmacopœia*, however, chiefly with the purpose of bringing it into use for the preparation of ointments, suppositories, and other similar preparations. Dymock considers it an excellent substitute for spermaceti, and recommends its employ-

--------	--------------	------------------

sures of the skin of the feet so common among natives in the cold weather
 (Surgeon-Major H. W. E. Catham, M.D., Ahmednagar). "The fruit is
 made into a sherbet, and as such is useful in fever as a cooling drink
 It is also anti-scorbutic" (Surgeon-Major A. S. G. Jayakar, Muskat).
 "Half an ounce of kokam butter, melted and mixed with a little boiled rice,
 is used in dysentery. The dose is repeated once daily" (Surgeon James
 McCloghry, Poona).

Food.—The purple fruit has an agreeable flavour, and has long been
 esteemed as an article of diet. It is mentioned by Garcia DeOrta (1563)

acid, but 13.53 per cent. of malic acid. The hot water extract formed 42.9 per cent., and the ash 7.88 per cent., of which 5.92 per cent. was soluble in water. The alkalinity of the ash calculated as potash was .79 per cent.

The concrete OIL is occasionally employed in native cookery, and is said to be largely used in Goa for the purpose of adulterating *Ghi*, a statement which is, however, contradicted by Dymock. Rumphius mentions that the YOUNG LEAVES were employed in Amboyana in cooking fish. The Collector of South Kanara, in a communication to the Government on the subject, published in 1889, states that "the SEED of the ripe fruit is swallowed raw by the natives as a delicacy."

Trade.—The average annual value of a full crop from a well grown tree is said in the Southern Konkan to amount to ₹7; and in the same locality the *Kokam* sells at 35lb per rupee, and the oil at 6 to 8lb per rupee (*Dir. Land Rec. and Agric., Poona*). Dymock states that the dried fruit obtained in Bombay comes principally from Goa, Hingoli, and Malwan, and is sold for ₹40 per kandy of 28 Bombay maunds of 28lb each, while the *Kokam* butter, which is principally obtained from Goa, fetches ₹5 to 7 per Surat maund of 37½lb. A small quantity of the latter is annually exported from Bombay, but the quantity cannot be accurately ascertained, since for statistical purposes it is not registered separately from other sorts of vegetable oils.

INDUSTRIAL
USES.

Candles.	51
----------	----

Industrial and Agricultural Uses.—*Kokam* butter yields stearic acid in larger quantities, more easily, and in a purer state than do most other fats, and therefore appears to be particularly suitable as a substance for candle-making. The learned authors of the *Pharmacographia*, commenting on this fact, write, "But that it is possible to obtain it in quantities sufficiently large for important industrial uses, appears to us very improbable." In connection with this remark it is worthy of notice, that the Director of Land Records and Agriculture, Poona, states that in Ratnagiri alone the number of trees is estimated at 13,000, and that they abound in other parts of the Southern Konkan. It, therefore, appears that the supply need not be so limited as Flückiger and Hanbury supposed, and that the preparation of *Kokam* butter may be an industry capable of considerable and profitable development.

MANURE.
Oil-cake.

52
53

MANURE.—The OIL-CAKE obtained as a by-product in the preparation of the concrete oil is considered excellent manure.

The Mangosteen.

(J. Murray)

GARCINIA
Mangostana.

1870-71, 33, 42.

Habitat.—An evergreen tree, native of the Straits, cultivated in British Burma on account of its fruit. Of recent years, it has also been successfully cultivated at a few places in the Madras Presidency. The attempts made by Roxburgh, in Bengal, and by several individuals in Bombay, to introduce this fruit tree into these presidencies have been unsuccessful. The former observes, "The plant has uniformly become sickly when removed to the north or west of the Bay of Bengal, and rarely rises

The Mangosteen: The Gamboge Tree.

gostine. As the physiological actions of the two latter constituents have not as yet been separately studied, it is impossible to say whether the effect caused by the drug is due simply to the tannin it contains, or whether the *resin* and *mangostine* may not possess peculiar therapeutic properties. The unanimity of opinion as to the efficacy of Mangosteen rind, evidenced in the following special opinions, would seem to indicate that it is a remedy of decided value, and that it probably does possess some property in addition to the simple astringency of tannin.

SPECIAL OPINIONS.—§ "The powder of the dried rind has been administered in intermittent fever with varying success" (*Honorary Surgeon P. Kinsley, Chicacole, Ganjam, Madras*). "The rind contains a good deal of tannic acid. In fine powder it is largely and effectively used in Burma for diarrhœa and dysentery, but I found it very efficacious in diarrhœa only. A wine of mangostin (51 to 51) is the best method of administration; dose for an adult, $\frac{1}{2}$ dr. to 51" (*Devendro Nath Roy, Campbell Medical School, Calcutta*). "The rind is used with benefit in cases of chronic diarrhœa in children" (*Bolly Chund Sen, Campbell Medical School, Calcutta*). "A decoction of the rind is a good astringent in chronic dysentery and diarrhœa" (*Surgeon D. Picachy, Purneah*). "This fruit is brought here in large quantities from the Straits Settlements in July and August. Natives suffering from gonorrhœa and gleet use it largely, as it lessens urethral irritation, and the discharge is in many instances completely arrested. It is, therefore, classed by them as a cooling and refrigerant fruit. A small quantity of the rind, steeped over night in cold water and taken in the early morning as a draught, is a valuable remedy for long standing diarrhœa, both in adults and children" (*Honorary Surgeon A. E. Morris, Tranquebar*).

Food.—The fruit is highly esteemed both by Europeans and Natives, and is indeed considered by many to be the most palatable of fruits. It is about the size of a small apple, with a thick, succulent, astringent rind, of a reddish-brown colour externally, but bright crimson on section. Within this are placed the 4 to 12 large seeds each surrounded with its juicy white aril, sweet and acidulous, with a delicate flavour like the odour of the primrose.

Trade.—A large quantity of the fruit, both fresh and dried, is annually imported from the Straits and may be purchased on the streets of Calcutta in small baskets, though it is customary to find the fruits of *Achras Sapota* passed off on the ignorant as Mangosteens. The fruit comes into season in May and June.

GARCINIA
Morella.

The True Gamboge Tree.

HISTORY.

"the juice of the tree under the Sanskrit name of *Tamāla* has long been employed as a pigment for making sectarian marks on the forehead by the Hindús of Kanara and Mysore." Towards the middle of the present century, specimens of Gamboge procured from Indian trees were carefully analysed and critically compared with pure Siam gamboge by chemists both in this country and in England, with the result that the two were declared to be practically identical. Notwithstanding this no attempt appears to have been made to collect the exudation free from impurities, and in such a state that it could compete with success with the pure "pipe gamboge" from Siam.

COLLECTION.
69

COLLECTION.—The gamboge of commerce, which is imported into Europe from Singapore, Bangkok, and Saigon, and is the produce of Siam, Cambodia, and the Southern parts of Cochín-China, is collected in the following way: "At the commencement of the rainy season a spiral incision is made in the bark round half the circumference of a full-sized tree, and the juice, which then slowly exudes for several months, is received into a joint of bamboo, which is placed at the lower end of the incision for that purpose. When the juice has hardened the shell of bamboo is removed, and the gamboge is thus obtained in the form of a roll or cylinder" (constituting the *Roll* or *Pipe Gamboge* of commerce). "According to Spencer St. John, a tree will yield on an average, in a season, sufficient gamboge to fill three joints of bamboo 20 inches in length, by about $1\frac{1}{2}$ inches in diameter. The trees should be incised in alternate years" (*Bentley & Trimen*). "*Cake*" or "*Lump Gamboge*" is obtained either from a similar incision, or by breaking the leaves and twigs, the yellow juice which exudes being collected either on the leaves of the tree or in cocoanut shells. A slightly different account is given by Flückiger and Hanbury quoting Dr. Jamie of Singapore. "The best time for collecting is from February to March or April. The trees, the larger the better, are wounded by a *parang* or chopping knife, in various parts of the trunk and large branches, when prepared bamboos are inserted between the wood and the bark of the trees. The bamboo cylinders being tied or inserted are examined daily till filled, which generally takes from fifteen to thirty days. Then the bamboos are taken to a fire, over which they are gradually rotated till the water in the gum-resin is evaporated, and it gets sufficiently hard to allow of the bamboo being torn off." These methods appear to have been untried in India, answers from forest officers to questions regarding the amount collected and methods of preparation shewing that as a rule minute incisions only are made from which small tears of the gum-resin are obtained. In Ceylon it is usually collected by cutting a thin slice of the size of the palm of the hand off the bark, here and there. On the flat space thus exposed, the gum collects and is scraped off when sufficiently dry. As a consequence only cake gamboge, or the gum-resin in small particles, is obtained, both of which forms are always much less pure than the Siam pipe gamboge. The District Forest Officer of North Malabar reports that, by making small incisions in the bark of a tree 16 inches in diameter, $\frac{1}{2}$ lb of first class pigment was obtained, but the method appears much more laborious, less productive, and more liable to result in the admixture of impurities than that of collecting in bamboos. A consideration of the literature on the subject indicates the advisability of giving the Siam method at least a fair trial.

Another method is reported from Madras, which consists in partially stripping the bark, pounding and boiling it, straining the resulting liquor, and inspissating it over a slow fire. This necessarily laborious and expensive process is said to yield an inferior article though in large quantities. But since gamboge to be of commercial value must be pure, and as the pure

The True Gamboge Tree.

GARCINIA
Morella.

article can be obtained by the bamboo method much more readily and cheaply, the experiment above described might naturally have been expected to prove unprofitable

DESCRIPTION AND CHEMICAL COMPOSITION—The "pipe" gamboge of commerce is found in the form of cylinders 1 to 2½ inches in diameter and 4 to 8 inches in length, with striations lengthwise, caused by impressions from the inside of the bamboo used in collecting. These cylinders may be distinct and covered externally with a yellowish brown dust, or may be agglutinated into masses of various sizes. The best samples are of a rich brownish orange colour externally, dense and homogeneous, brittle, with a

CHEMISTRY
70

the colour and consistence of Siam gamboge, but contained many impurities, while fully half the sample was of a dirty yellow brown colour and

able product

Chemically, gamboge consists of a mixture of resin with 15 to 20 per cent of gum. The resin dissolves easily in alcohol, forming a clear liquid of a fine yellowish-red hue and acid reaction. Buchner assigns to it the formula $C_{60}H_{28}O_{12}$. Flückiger and Hanbury state that the gum (which they obtained to the extent of 15.8 per cent by completely exhausting the gum-resin with alcohol and ether), was found to be readily soluble in water, not acid in reaction, and therefore not identical with gum arabic. As already stated, impurities are of common occurrence—rice-flour, sand, or the pulverised bark of the tree being amongst the most common. These mechanical impurities are readily recognised in the residue left after exhausting the gum-resin, while the starchy adulterants are easily detected by adding a solution of iodine to the decoction, a green colour being produced.

Dye and Tan—The GUM RESIN is employed by the Burmans for dye-

GARCINIA pedunculata.

The Garcinias or Gamboge Trees.

MEDICINE.
Gamboge.
74

Medicine.—**GAMBOGE** is largely employed as a hydragogue and drastic cathartic and anthelmintic. It is particularly valuable in cases of anasarca and other dropsical affections, and in obstinate constipation. In overdoses it is a violent gastro-intestinal irritant poison, and ought to be administered with caution, especially to children. When prescribed alone, it is liable to cause severe griping, and is therefore almost always given in combination with other purgatives and carminatives. Moodeen Sheriff states that Mysore gamboge must be given in half larger doses than the officinal drug, doubtless because it contains a proportion of inert impurities. It is also employed by the natives as an external application to relieve pain and swelling, and Dr. Gray reports that broken pieces of the **BRANCHES** rubbed up with water are used as a household remedy for boils.

Branches.
75

SPECIAL OPINIONS.—§ “Siam gamboge is one of the best purgatives in India, and a much stronger drug than jalap. Like the latter, it acts very satisfactorily in combination with other purgatives or laxatives; but not so well when used alone. During the last twenty years, I have used this medicine in Triplicane Dispensary with cream of tartar, whenever jalap was out, and never felt the want of the latter. The cheapness and abundance of Siam gamboge in this country is another advantage which it possesses over jalap (*Honorary Surgeon Moodeen Sheriff, Khan Bahadur, Triplicane, Madras*). “Mixed with other medicines and applied over sprains and contusions, it relieves pain and swelling” (*Surgeon-Major A. S. G. Jayakar, Muskat*). “The stem rubbed with water is a household remedy amongst natives, as a local application to rising pimples and boils, and often cuts them short” (*Civil Surgeon R. Gray, Lahore*).

Habitat.—A highly ornamental tree, confined to the forests of the southern portions of the Travancore and Tinnevelly Ghâts, at elevations of from 3,000 to 4,500 feet (*Beddome*).

GUM-RESIN.

96

Gum-resin.—*Beddome* states that every portion of the tree yields an abundance of bright yellow gamboge. No information, however, regarding the chemical composition or physical characters of this gum-resin is available, and it is therefore not known to what extent it might be utilised as a pigment, dye, or varnish.

97

Habitat.—A widely distributed species met with in Eastern Bengal, the Eastern Himalaya from Sikkim to the Khásia Mountains, Burma, Southern India, Penang, and the Andaman Islands.

GUM-RESIN.

100

Gum-resin.—This species yields a large quantity of inferior gamboge, both from the stem and fruit-rind. *Roxburgh* states that it is of inferior quality, but it is extensively utilised as a dye in Assam. *Lisboa* describes the gum-resin obtained from the fruit as follows: "From the full-grown, but not ripe, fruit, a quantity of creamy, resinous, yellow, gum-like gamboge is obtained, which makes a tolerably fair water colour, and might be used either by itself or mixed with blue to form green." No definite account exists of the chemical and physical properties of this gum-resin, but it would seem to contain a larger proportion of gum than that derived from the other species.

DYE.

Bark.

101

Dye.—The BARK is employed by the Phakials of the Lakhimpur district of Assam for dyeing cotton. The process which they employ is described by the Deputy Conservator of Forests of the province, as follows:

* *U. C. Dutt* states that the above Sanskrit, Hindústani, and Bengali names are applied to this plant, as well as to *Cinnamomum Tamala*, *Nees*.

I., 436.

Habitat.—A large shrub met with in Central and South India, from the Satpura Range southwards.

GUM-RESIN.

II7

Gum-Resin.—The remarkable gum-resin, *dikamali*, or *cumbi-gum*, is obtained from this species and from *G. lucida*, Roxb. The exudation from both species is apparently identical, and in both cases forms transparent tears from the extremities of the young shoots and buds. These shoots and buds are broken off with the drops of gum-resin attached, and exposed for sale either in this form, or after agglutination into cakes or irregular masses.

Characters.

II8

CHARACTERS AND CHEMICAL COMPOSITION.—Commercial *Dikāmāli* occurs either in the form of the twigs coated with and agglutinated by the gum-resin, or as irregular earthy-looking masses, of a dull olive-green colour which consist of the resin more or less mixed with bark, sticks, and other impurities (Cooke). It has a peculiar and offensive odour like that of cat's urine. When carefully collected and free from impurity it is transparent and of a bright yellow colour. The gum-resin has been examined by Flückiger, Dymock, and later by I. Stenhouse and O. E. Groves, and has been found, by the last two investigators, to contain two distinct resins. One of these, an amorphous greenish-yellow substance, is by far the largest constituent; the other occurs only in small proportion, and is obtained in slender, pale, yellow, crystalline needles. To the latter the name of *Gardenin* has been applied. In the investigation referred to, *gardenin* was separated by boiling the *Dikāmāli* with alcohol, filtering the solution and allowing the filtrate to cool. The needles thus obtained were washed with cold spirit to free them from the green amorphous resin, and then treated

Habitat.—A small deciduous tree, met with in the dry hilly districts of Western, Central, and South-Western India, also in the North-Western Himalaya, in Garhwál only, where it ascends to 3,000 feet, and in Behar and Western Bengal.

FOOD.

Fruit.

125

TIMBER.

126

DOMESTIC.

127

Food.—“The FRUIT is eaten by the Santals” (*Rev. A. Campbell*).

Structure of the Wood.—White, with a yellowish tinge, close and fine-grained, weight 52 to 53lb per cubic foot. It is easy to work and durable, and has been recommended as a substitute for box-wood, and as likely to be useful for the purposes of the engraver and wood-turner. It is employed by the Natives to make combs.

Domestic, &c.—The plant is recommended by Roxburgh as worthy of attention for ornamental purposes. He writes, “Its large, glossy, green leaves, independent of the size, beauty, and fragrance of the flowers, render it highly ornamental.”

Habitat.—A tree, attaining the height of from 30 to 40 feet, met with in the Sub-Himálayan forest from the Jumna eastwards, where it ascends to 3,000 feet, also in Central and Southern India, Chittagong, and Burma. It flowers from February to March, and the fruit ripens in June and July.

Gum-Resin.—This tree yields a greenish-yellow, translucent exudation in small mamilliform masses, having a mild terebinthinate odour and taste. It has been generally regarded by Indian writers as a true gum, Watson and Cooke, amongst others, classifying it with Gum acacia, &c. *Dymock*, however, states that it contains small proportions of an oleo-resin, and is in reality a gum-resin. He writes, "Only a small part of it is soluble in rectified spirits, causing a slight turbidity; in water it rapidly disintegrates, forming a tolerably thick mucilage, in which globules of oleo-resin may be seen with the microscope. The insoluble portion is amorphous, flaky, and white; after its removal the mucilage is precipitated milk-white, by rectified spirit." No record exists in economic literature of this exudation being utilised in the arts, but in Bombay it is employed as a medicine. Mr. O'Connor mentions Garuga in his list of trees on which lac is produced.

Dyes and Tans.—The BARK is used for tanning in many parts of the country, and is said by Kurz to be good for that purpose. The same writer mentions that in Burma the LEAVES are frequently invested with large, red, obovate, apiculate galls.

Medicine.—*Dymock* writes: "In Salsette, near Bombay, the JUICE OF THE STEM is dropped into the eye, to cure opacities of the conjunctiva" (? cornea). "The FRUIT, which is greenish yellow, and about the size of a gooseberry, is pickled and eaten as a cooling and stomachic remedy; it is strongly acid. In the Konkan the JUICE OF THE LEAVES, with that of the leaves of *Adhatoda Vasica* and *Vitex trifolia*, mixed with honey, is given in asthma."

Food and Fodder.—The fleshy, smooth, black, acid DRUPE is eaten raw, pickled, or cooked by the natives. As above stated, it is considered a semi-medicinal article of diet. The SHOOTS and LEAVES are collected for fodder, especially for elephants.

Structure of the Wood.—Greyish or yellowish, heartwood dark reddish-brown, rather heavy (about 40lb per cubic foot), coarsely fibrous, but

Vern.—*Karré*, *kúti*, HIND.; *Karú*, *kúti*, BENG.; *Nihant*, *Karalphul*, *nilatil*, root=*karré*, PD.; *Phákhánda*, *patánda*, BOMB.; *Paákhán-lárd*, GUZ. According to Dymock, *patánda*, though applied by Muhammadan writers to this plant, is the name associated in Bombay with what appears to be the root of an Iris.

References.—Stewart, Pl. Pl., 157; Clarke in Jour. Linn. Soc., XIV., 420; Pharm. Ind., 125; O'Shaughnessy, Beng. Dispens., 259; Atkinson, Him. Dist., 313, 737; Kew O. Guide to the Mus. of Ec. Bot., 92; Gazetteer, Panjáb, Simla Dist., 12.

Habitat.—A small herb, with a handsome blue flower, common in Kashmir and the North-West Himalaya, altitude 5,000 to 11,000 feet.

Medicine.—The root is used medicinally as a bitter tonic, and as a substitute for the true Gentian. On the hills it is viewed as a febrifuge, and is largely exported to the plains along with *Picrothiza Kurroo*, Royle, as the official *karrú* or *kúti*, of which Stewart says 36 maunds were, in 1867, brought from Kulu and exposed for sale at Rampúr. Davies' Trade Report gives 20 maunds as annually exported from Pesháwar to Kabul, and Atkinson says that five tons are annually exported from the hills to the plains. It appears probable that the root of this species is very similar to that of *G. lutea*, which forms the true Gentian of commerce, the chemical composition and medicinal properties of which will be described below.

SPECIAL OPINIONS.—§ "Used principally as a *masálak* for fattening horses" (Surgeon-Major C. W. Calthrop, M.D., Meerut). "Acts as an aperient in larger doses" (Civil Surgeon R. Gray, Lahore). "Said to diminish the fever of phthisis" (Surgeon J. C. H. Peacocke, I.M.D., Nasik). "Used for urinary affections" (Surgeon-Major S. M. Robb, Civil Surgeon, Ahmedabad).

The European Gentian

(J. Murray)

GENTIANA
tenella.

Habitat—A handsome perennial herb, native of the alpine and sub-alpine regions of South Europe. The dried root of the plant is imported into India.

Medicine—The name of the root is used to label the dried root of the plant.

MEDICINE
Root
168

tions of modern practice. In India also it is extensively employed both by European and Native physicians, but it appears probable that a more careful and exhaustive examination of indigenous species may lead to the substitution of one or more of them for the imported article. As already stated, *G. Kurroo* appears to be the best known and most widely employed of these native species, and would perhaps, on examination, be found to afford the best substitute.

CHEMICAL COMPOSITION—According to the learned authors of the *Pharmacographia*, the bitter taste of Gentian root is due to a principle, *Gentiosaprin*, $C_{20}H_{20}O_{12}$, which, under the influence of a dilute mineral acid, is resolved into glucose, and an amorphous, yellowish brown neutral substance called *Gentigenin*. Another constituent is *Gentianin*, $C_{14}H_{10}O_8$, a tasteless substance occurring in yellowish prisms. Besides these the root contains pectin to a large extent, and 12 to 15 per cent. of an uncrySTALLIZABLE sugar, "of which advantage is taken in Bavaria and Switzerland, for the manufacture, by fermentation and distillation, of a potable spirit." The root contains no tannic acid.

CHEMISTRY
169

ACTION AND USES.—Gentian possesses in a high degree the tonic properties which characterise the simple bitters, of which it is perhaps the most powerful and active. It possesses the advantages of the

Medicine.—*Kurz* writes that this PLANT possesses qualities similar, though inferior, to those of *Cephaelis Ipecacuanha*.

MEDICINE.

Plant

176

GERANIUM, *Linn.*; *Gen. Pl.*, I., 272.

A genus of herbs or undershrubs, belonging to the Natural Order GERANIACEAE and comprising about 100 species, of which from 15 to 20 are natives of India. Many species are extensively cultivated as flowering plants. The generic name is derived from the Greek γεράνιον (a crane) owing to the supposed resemblance of the fruit to the head of that bird. Certain species appear to have been known from remote times to possess medicinal virtues. Thus *Dioscorides* mentions a plant called γεράνιον as employed for its astringent properties; *Pliny* alludes to two species.

Habitat.—A herbaceous prostrate plant, common throughout the temperate Himálaya at altitudes of from 5,000 to 9,000 feet; found also in the Khásia Hills, the mountains of Southern India, and Ceylon. Distributed to Yunnan.

Dye.—The root, which greatly resembles that of *Onosma echinoides*, affords an abundance of red colouring matter, which is said by *Dymock* to be employed in colouring medicinal oils. *Stewart* states that it forms an article of trade, being brought from the hills to the plains of the Panjáb and sold as a dye.

Medicine.—The PLANT possesses the astringent properties of the genus, and is employed, at least in the Panjáb, as an astringent, and in certain renal diseases.

Habitat.—A herbaceous procumbent plant of the Western Himálaya, from Murree to Kumáon, between the altitudes of 4,000 and 8,000 feet. The variety *pulsilla*, which is apparently a starved condition of *G. lanuginosa*, extends to Nepál.

FIBRE.
Leaf.
187

Fibre.—The under-surface of the LEAF is covered with a cotton-like tomentum, which is employed by the natives of the Himálaya as tinder, and for the manufacture of cloth. This tomentum has attracted considerable attention at different times, and has been variously recommended as a cloth-making fibre, as a paper-making material, and as a substitute for cotton in the manufacture of explosive compounds. No practical result, however, appears to have been produced by these suggestions, and the fibre is still employed by the natives only. The tomentum is prepared for use as follows:—About the middle of the rains, when the leaf attains its full size, the plant is gathered, the point of the leaf is severed, and the down stripped off towards the base in an entire layer. It is then without further preparation twisted into a thread, on the common perpendicular "*churka*" of the country. From the thread thus prepared a cloth is woven, from which blankets, sacks, and bags are made by the hill people. This cloth has been described as very highly prized for its strength and durability, and superior to that manufactured from hemp. It is very frequently employed also for making the characteristic bags in which the hill-men carry their *hookahs*. The tomentum can only, however, at best be obtained in very small quantities and is of interest as a curiosity only. It can never prove of commercial value.

GEUM, Linn.; *Gen. Pl.*, I., 619.

188

A genus of perennial ROSACEÆ, which derives its name from the Greek γενο, an agreeable taste, on account of the slightly aromatic flavour of the roots of certain of the species. Two are natives of India, *G. elatum*, Wall., and *G. urbanum*, Linn. Neither appears, however, to be recognised in this country as of value, a somewhat remarkable fact in the case of the latter, which is the *Aveus*, *Radix Caryophyllata*, or HERB BENNET, of old European herbalists. The root of this species has a clove-like odour, and, owing to its stringent properties, has been employed in cases of dysentery, diarrhœa, &c. It was also used to flavour ale in olden times, and has been recommended in cases of caries of the teeth, &c., to impart an agreeable odour to the breath. *G. urbanum* (Linn.; *Fl. Br. Ind.*, II., 342) is to be found in India, on the Western temperate Himálaya, from Murree to Kumáon, at an altitude of 6,000 to 11,000 feet.

Bengal.

measure can be given for the quantity of water to be added to the curd before churning, as it depends upon the consistency of the latter; generally, however, one quart of water is considered sufficient for three quarts of curd. The water ought to be gradually added during the process of churning. In the cold weather hot water is first added until the butter begins to form, after which cold water is dashed in to expedite the process.

It is not absolutely necessary that the fuel should consist of cowdung. Nor is it necessary that the milk should be heated for five or six hours; indeed, the acid whey or curd is in some places put into raw cold milk. By this process, however, a longer time is necessary to curdle the milk. It is stated that the longer the curdled milk is kept unchurned, the larger is the yield of butter, and that the maximum time for which curdled milk can be kept without deterioration is three days. The proper time for churning is the cool morning hours, as after sunrise the butter does not form into good large lumps, and owing to the heat is liable to get thin and to mix with the whey.

Near large towns where there is a great demand for milk and curd, people sometimes take off the crust or cream and sell the milk in a raw or curdled state. The cream is then churned and the butter obtained is melted into *ghi* in the usual way. Generally speaking, however, the manufacture of *ghi* is confined to villages where there are no purchasers for milk, as it is more profitable to sell milk in the raw state than to convert it into *ghi*.

In certain localities, such as the Monghyr and Bhagalpur districts, butter is extracted by churning the raw milk, either fresh or after being boiled. The milk is then sold either raw or curdled, and *ghi* is made by heating the butter.

In the Tippera district milk is first boiled down to the consistency of a thick hard jelly, thus forming a substance known as *khîr* in Bengal and *khoya* in Upper India, which is eaten as a delicacy and enters largely into the composition of most of the native sweetmeats. This substance is ground on a stone, placed in an earthen or a metallic vessel, reduced to a liquid state by mixing water with it, and then churned. The butter thus obtained, when melted, is said to yield a superior quality of *ghi*.

Rajputana
192

In Rajputana.—The process adopted differs somewhat from that detailed above, and is thus described by A. Wingate, Esq., C.I.E., Settlement Officer, Meywar:—

"The milk is slowly boiled on a cowdung cake fire, and occasionally stirred with an iron spoon to prevent it boiling over. A little whey is poured in to make the cream rise. The white curds are then skimmed off and kept in earthen or brass pots till a sufficient quantity is collected. These curds are then poured into a large earthen vessel and some warm water added. The churn called 'rawai' is at once put in and worked by a woman. From time to time cold water is freely added. The butter is then collected with the hand into a similar earthen pot, and heated till it melts. The melted butter is then laid aside to cool, and is thenceforth known as *ghi*. The best *ghi* is white, like soft lard, and has no smell, and keeps good for almost any length of time.

"Every household makes its own *ghi*, and the 'chach' or watered skim milk is much used for drinking at meals with Indian-corn porridge or baked cakes. The villagers, in making *ghi*, mix all their milk up together, whether obtained from the cow, buffalo, or goat, and the shepherd classes also add the milk of their sheep. Consequently *ghi* sold in the bazars is frequently very strong in smell and taste, and of reddish-yellow colour.

"The amount of *ghi* from a given quantity of milk depends altogether upon the feeding of the cattle. Most families keep one or two milch kine and buffaloes at home and feed them well. Such cattle, they say, give

warmed and strained, the butter becomes *ghí* and in the change it loses 25 per cent. of its weight. On the average, therefore, each buffalo in milk gives the equivalent of two fifths of a seer ($12\frac{1}{2}$ ozs.) of *ghí* per diem."

In Bundelkhand, Rájputana, and other localities, *ghí* is also made from sheep and goat's milk. That of the latter is inferior, owing to the disagreeable odour it possesses; while *ghí* made from the former is said to be better in many ways than that of the buffalo.

In many parts of the country *ghí* obtained from cow's milk is highly esteemed, owing partly to its superior quality, and partly to its greater purity from a religious point of view. It is, however, always dearer than buffalo milk *ghí*, not so easily procurable, and is moreover more liable to deterioration. It is of a yellowish colour, and has a more pleasant odour and agreeable taste than that prepared from buffalo milk.

The following statement of the comparative yield from different kinds of milk drawn up by the Superintendent of the Government Farm, Cawnpore, may be here given:—

Cattle.	Weight of fresh milk.	Weight of boiled milk.	Weight of curdle.	Weight of Matha (curdle & water).	Weight of Nainu (ram <i>ghí</i>).	Weight of <i>ghí</i> .	Percentage of <i>ghí</i> over fresh milk.

ADULTERANTS.
195

ADULTERANTS.—The chief articles employed in adulterating *ghí* are vegetable oils, animal fat, especially mutton-fat, and starches. Of the last the commonest are: rice-flour, flour of *bajra* millet (*Pennisetia spicata*), ripe plantain, and the starch obtained from the boiled tubers of *Ipomoea Batatas* and *Colocasia antiquorum*. Of vegetable oils the oils of cocoa-nut, poppy-seed, sesamum, *mahuá* (*Bassia latifolia*), and *kokam* (*Garcinia indica*) are most frequently employed, and occasionally also raw castor-oil. Besides these other impurities occur, resulting from imperfect heating and careless preparation. Several methods of purification are adopted, the commonest being to boil the *ghí*, dash cold water on it while in a state of ebullition, and then to separate the pure oil which on cooling floats on the surface. In Rájputana fresh milk is mixed with the impure *ghí*, in the proportion of one of the latter to four of the former, and the whole process of manufacture is repeated. In certain other localities purification is effected by heating the *ghí* with leaves of lemon.

PACKING.
196

PACKING.—Formerly all *ghí* was packed for local use in earthen jars, and for transport to a distance in leathern cases called *kuppas*. Of late years, however, old kerosine tins, and new tins of the same shape and size, have come into almost universal use in all cases in which the *ghí* is required for transport by sea or rail. In Madras, Rájputana, and Sind, however,

Ghi or Clarified Butter	(F Murray)	GHI

GHI.

Ghi or Clarified Butter.

EDICINE.

eyes, &c." It is much valued as an application for reducing the temperature in high fever.

FOOD.
199

Food.—*Ghi* has long been one of the most important articles of diet of all classes who can afford it in India. Linschoten makes frequent reference to its extensive employment in Sindh, Bombay, and other places which he visited along the coast in his travels. The *Ain-i-Akbari* contains it in the list of more important articles of food during the reign of Akbar, and reference is frequently made to *ghrita* in many ancient Sanskrit works. It is used in much the same way as butter in European cookery, being employed in the preparation of vegetables, curries, pulses, meat, rice *palao*, &c. It is also eaten uncooked with bread or boiled rice, and enters into the composition of the sweetmeats and pastry so extensively consumed by the population of all large towns. The poorer classes reserve the use of *ghi* as a luxury for feast days and festivals, and substitute, for ordinary consumption, some of the sweet vegetable oils.

DOMESTIC.
200
SACRED.
201

Domestic and Sacred uses.—In parts of India where vegetable oils are expensive, *ghi* is said to be employed by women for dressing the hair, &c. *Ghi* prepared from cow's milk is largely used in many religious and social ceremonies of the Hindús; thus it is burnt as an offering to the fire-god (*Agni*), and with sandal-wood in Bombay to invoke Lakshmi.

PRICES.
202

Prices and Trade.—Reports submitted at different times to the Revenue and Agricultural Department indicate that, as a rule, the selling price of *ghi* ranges between 5*d.* and 7*d.* per lb. In Bombay, Madras, Calcutta, and other large centres of demand, however, the price ranges as high as 11½*d.* to 1*s.* for first quality *ghi*; and, as already stated, that prepared from the milk of the cow always fetches a higher price than that made from buffalo milk. Though by far the greatest proportion of *ghi* prepared within the country is consumed in India, a considerable trade exists with trans-frontier countries, and also with foreign ports, principally Mauritius, the Straits Settlements, and other colonies where well-to-do Native emigrants can afford to purchase it. As might be expected from the almost universal consumption of the article, the inter-provincial trade returns shew a large traffic in *ghi*. The following figures indicate the trade by rail and river during the year 1888-89, including the Indus-borne traffic between the Panjáb and Sind, that between Bengal and Assam, by the Brahmaputra and Megna, and the trade to and from Calcutta by river. The North-Western Provinces and Oudh exported 1,88,521 maunds, Bengal 85,587 maunds, Madras 42,019 maunds, the Panjáb 25,633 maunds, the Central Provinces 20,811 maunds, and Berar, Bombay, Assam, and Sind smaller amounts. Of the large towns excluded in the above figures, Calcutta exported 24,903 maunds, Karachi 10,868 maunds, Bombay 4,498 maunds, and Madras 477 maunds. The largest amounts imported were by Calcutta, 1,43,897 maunds, Bombay town 98,894 maunds, Madras seaports 32,907 maunds, Sind (excluding Karachi) 36,047 maunds, Bengal 31,440 maunds, Bombay 29,380 maunds, Rájputana and Central India, 27,840 maunds, and the Panjáb 25,196 maunds.

TRADE.
203Inter-prov-
incial.
204

An extensive import trade is carried on with the frontier states, the amount and value of which for the past three years has remained remarkably uniform. The figures are:—

The principal sources of supply are Kashmir and Nepál, the latter of which in 1887-88 supplied 14,995 cwt., the former 34,153 cwt. There is also a small export trade, which, however, is almost entirely confined to Upper Burma, Kashmir, and trans-frontier by the Sind-Pishun Railway, the *ghi*

Products of India

Ghi or Clarified Butter

(F Murray)

thus exported being consumed almost entirely by Indian troops and soldiers

The imports from foreign countries represent a large and constantly increasing trade, but bear a very small proportion to the figures representing the trans-frontier and inter-provincial trades. There appears to be little doubt that if a source of cheap supply could be found, the consumption, and consequently the imports from foreign countries, might become very greatly increased. The average import for the past five years has been 1,980,709lb, value Rs 7,14,122, in comparison with 431,912lb, value Rs 1,22,459, of the five years immediately preceding. It may be noted also that the imports of the year 1888-89 increased to 2,731,280lb, in comparison with 1,382,389lb in 1884-85. The imports are almost entirely into Bombay and Karachi, the sources of supply are Turkey in Asia, the neighbouring pastoral tracts of Southern Baluchistan, and the shores of the Persian Gulf.

As in the case of the trans-frontier trade, the chief foreign markets to which ghi is exported are Mauritius, the Straits Settlements, Aden and other similar colonies, where well to do Indian emigrants supply a market. A certain amount is also exported to the neighbouring coasts of Africa and Asia, and a small quantity is despatched to the United Kingdom, possibly for re-export to some of the colonies. The average export for the past five years has been, 1,938,092lb, value Rs 7,10,287, or almost exactly equal to the average import, and shews little change in comparison with that of the five years ending 1883-84, which was 1,659,613lb, value Rs 83,423.

The coasting trade is a large and increasing one, but, like the trans-frontier exports, its most remarkable feature is the transport of ghi to Indian consumers in non-producing districts. In 1888-89 the total export from Bengal was 1,322,539lb, value Rs 4,87,575, from Bombay 1,181,542lb, value Rs 4,33,303, from Sind 136,465lb, value Rs 49,856, from Madras 2,182,832lb, value Rs 6,88,736, and from Burma 23,068lb, value Rs 9,112. By far the largest importer was Burma, which recorded 3,412,644lb, value Rs 13,05,499, chiefly from Madras and Bengal. The probable reason of this large consumption in a country, the Buddhist inhabitants of which do not employ ghi as an article of food to any extent, is probably the large and increasing population of emigrants from Madras, Bengal, and other provinces of the main peninsula.

Coasting,
207

Australian,
208

In 1881 an endeavour was made by the Government of India to give an impetus to Indo-Australian trade, by establishing a return trade, the absence of which greatly augments the price of exported Indian goods by causing high shipping rates. It was considered that the only article besides animals, timber, and metals, which could profitably be thus sent to India was ghi, for the production of which the northern portion of South Australia appeared to possess many advantages. Sir E. C. Buck accordingly drew out a memorandum drawing the attention of the Australians to the subject, and suggesting the methods by which such a trade might be most profitably and advantageously commenced. As an outcome of this suggestion, buffaloes and ghi makers were asked for, and were supplied by the Government of India in 1883. Experiments were started at Port Darwin, with the result that the buffaloes were found to thrive well and to breed healthy calves, and excellent ghi was produced, which obtained a gold medal at the Calcutta Exhibition in 1884. The initial cost was necessarily high in proportion to the smallness of the herd, and accordingly, the success of the experiment to the smallness of the herd, and is yet established. The industry is one, however, that appears to have a hopeful future. The demand is a large and constantly increasing one, the climate of the northern territory of South Australia is admirably suited

TRADE
IN GHI.

for buffaloes, and if managed with due attention to the prejudices of the consumers, and by the help of imported Indian labour, there appears to be every likelihood of such an enterprise affording a good return.

GIGANTOCHLOA, Kurz; For. Fl. Burm., II., 555.

A genus of evergreen densely tufted bamboos, which are employed for the same purposes as other members of the Tribe BAMBUSEÆ. For information regarding these the reader is referred to Vol. I., 370. The following are the principal Indian species:—

- 209 Gigantochloa albo-ciliata, Kurz; For. Fl. Burm., II., 555; [GRAMINEÆ.

Syn.—OXYTENANTHERA ALBO-CILIATA, Munr.

Vern.—Waggyugale, BURM.

Habitat.—Common in the mixed forests of Pegu and Martaban.

- 210 G. andamanica, Kurz; For. Fl. Burm., II., 556.

Vern.—Podak, AND.

Habitat.—Common in the mixed forests of the Andamans.

- 211 G. auriculata, Kurz; For. Fl. Burm., II., 557.

Vern.—Talaguwa, BURM.

Habitat.—An evergreen arboreous tufted bamboo, found in the low forests of Southern Pegu, but rather rare, cultivated in villages of Arracan and Chittagong. A useful timber with very strong stems.

- 212 G. macrostachya, Kurz; For. Fl. Burm., II., 557.

Vern.—Wanet, BURM.

Habitat.—Not unfrequent in the tropical forests of Martaban and Tenasserim, also cultivated in the villages of the Irrawaddi valley and of Arracan.

Ginger; see Zingiber officinale, Roscoe; SCITAMINEÆ.

Ginger Grass; see Andropogon Schœnanthus, Linn., Vol. I., 249.

Gingelly Oil, a name in India for an oil obtained from Sesamum indicum, DC.; PEDALINEÆ, which see.

GIRARDINIA, Gand.; Gen. Pl., III., 384.

A genus of annual or perennial herbs, belonging to the Natural Order URTICACEÆ.

- 213 Girardinia heterophylla, Dcne.; Fl. Br. Ind., V., 550; Wight, Ic., [t. 687; URTICACEÆ.

Habitat—A tall, stout, erect, tufted herb, from 4 to 6 feet high, exceed-
ingly common in the temperate and sub-tropical Himalaya, from Marri-
eastwards, ascending to an altitude of 5,000 feet. It is also to be met
with in Assam, Sylhet, and Burma, and extends from Marwar and Central
India to Travancore and Ceylon. The variety *palmata* is a native of the
Nilghiri hills and Ceylon, while *zeylanica* is confined to the latter locality
and parts of the Deccan.

Fibre—Considerable confusion exists in the literature of the fibres
yielded by this species, apparently owing to a neglect of the fact that the
three varieties afford fibres which are perfectly distinct in many of their
characters. It is, therefore, necessary in the present article to consider
the varieties separately, as far as the fibre of each is concerned.

FIBI
2X

G. heterophylla proper.—The Himalayan nettle is extensively employed
in the localities where it abounds. "Its stems are often employed for
making twine and ropes by the dry process, but these are not prized, and
perish quickly from wet" (Stewart). "Yields a fine strong fibre, much
used for cordage and twine, but cannot stand much moisture" (Atkin-
son). Dr Forbes Watson, in his report upon Rheea Fibre, publishes
under this species certain facts regarding what appears to be the
fibre of *var. palmata* and reproduces Wight's plate of *var. zeylanica* as
representing the typical species. This same mistake has been made by
other authors, all the economic information regarding *Guaradma* being
confused and given under one or other of the above names. Under the head-
ing of "Other Himalayan Nettles," Dr Royle gives certain facts regard-
ing what appears to be the fibre now under consideration. Having arrived
at the conclusion that the *hori surat* of Assam was identical with the fibre
of the Nilghiri nettle of Southern India, he apparently could not reconcile
himself to class with these the *badar* of the Himalaya, nor the fibre from
which the *daugra* cloth of Sikkim was made. Presumably, therefore,
he merely classed the Assam fibre with that of the Nilghiri nettle from de-
scriptions he had received, and not from actual observation. Had he
actually seen the fibre he must have assigned it a place with the fibres
of the North-West Himalaya nettle, with which it is in reality identical. The
following description of the method of preparation pursued near Simla,
given by Captain Rainey and quoted by Royle, may be here reproduced,
as being the most complete account available: "In August and Septem-
ber, when the plant is in perfection, it can be obtained in any quantity,
running from five to six or seven feet in height." "The following is the
preparation to which the article is subjected by the natives of the place,
but, I doubt not, much of the process might be omitted or simplified."
"1st—Being cut in August or September the weed is exposed for one
night in the open air.
"2nd—When well dried it is stripped of leaves and dried in the sun.
"3rd—The stalk thus boiled (the refuse remains of any wood fire) and
boiled for four and twenty hours.
"4th—The stalk is then taken to a stream and well washed
"5th—The hemp is then brought home, and being sprinkled with
flour (*atta*) (of the grain called *Kada*) it is again dried in the

GIRARDINIA
heterophylla.

The Nilghiri Nettle.

FIBRE.

sun, and afterwards spun at any time into cords for nets of every description."

In Garhwāl and other localities in the North-West Himālaya, a simpler method appears to be followed. The plant is cut down in the beginning of the cold season, the stalks are washed three or four days in water, and the fibre is stripped off like that of hemp. It is a fine, white, glossy, silky fibre, but is coarser and more brittle than that yielded by *var. palmata*. According to Captain Rainey it is extensively employed in the preparation of twine for fishing-nets, in consequence of the virtue ascribed to it by the Natives of gaining increased strength by immersion in water, and of resisting decay longer than other fibres. It is also used in Sikkim for the manufacture of a coarse cloth like gunny.

Var. palmata—the true Nilghiri nettle—yields a finer and more valuable fibre than *G. heterophylla* proper. Royle writes: "The fibre is very long white, soft, and silky, and has been much admired by many of the best judges of fibres. The hill people on the Nilgiri hills prepare the fibre by boiling the twigs. Dr. Wight says of it that 'it produces a beautiful fine and soft flax-like fibre, which the Todawars use as a thread material, and if well prepared is fitted to compete with flax for the manufacture of even very fine textile fabrics.'

"At Dundee it was thought a very good fibre, but rather dry. Mr. Dickson, who has passed it through his machine and liquid, has rendered it like a beautiful, soft silky kind of flax, and calls it a wonderful fibre, of which the tow would be useful for mixing with wool as has been done with the China-grass, and the fibre used for the finest purpose." Dr. Forbes Watson, speaking of what is apparently this variety, says: "The remarks made with respect to the rough character of the Rhea fibre are still more applicable to those of the Nilghiri nettle. Indeed, so similar to wool is its fibre that when cut short and crumpled up or 'scribbled,' I have known it valued by an experienced broker as wool, and its price stated accordingly. The term 'vegetable wool' which it has already received is, therefore, very suitable." The same writer gives the mean diameter of the ordinary fibre as $\frac{1}{100}$ and the ultimate fibre as $\frac{1}{500}$ of an inch; and Cross, Bevan, and King give the following analysis: "Moisture 7.3, ash 1.5, hydrolysis (a) 2.5, (b) 9.7, cellulose 89.6." In *Spon's Encyclopædia*, the Girardinias are spoken of collectively under the name of *G. heterophylla*, but it seems that *G. palmata* alone is meant. The following extract may be found useful: "It succeeds well by cultivation. The bark abounds in fine, white, glossy, strong fibres, which have a rougher surface than those of *Boehmeria nivea*, and are therefore more easily combined with wool in mixed fabrics." Owing to the high percentage of cellulose and the small loss from hydrolysis, the fibre is chemically one of the best produced in India.

The late Mr. M'lvor, of the Government gardens, Ootacamund, experimented with the Nilghiri plant and submitted a most interesting report to the Madras Government. The following extract from *Drury's Useful Plants* will be found to contain briefly the more important facts from Mr. M'lvor's report:—

"Cultivation.—The Nilghiri nettle has been described as an annual plant; it has, however, proved, at least in cultivation, to be a perennial, continuing to throw out fresh shoots from the roots and stems with unabated vigour for a period of three or four years. The mode of cultivation, therefore, best suited to the plant, is to treat it as a perennial by sowing the seeds in rows at fifteen inches apart, and cutting down the young shoots for the fibre twice a year,—*viz.*, in July and January. The soil best suited to the growth of this plant is found in ravines which have

CULTIVA-
TION
215

Products of India

The Nilghiri Nettle

(F. Murray)

GIR
heter

received for years the deposit of alluvial soils washed down from the neighbouring slopes. In cutting off the first shoots from the seedling crop, about six inches of the stem is left above the ground, this forms 'stools' from which fresh shoots for the succeeding crops are produced. After each cutting the earth is dug over between the rows to the depth of about eight inches, and where manure can be applied it is very advantageous when dug into the soil between the plants, owing to their stinging property. The plant is indigenous, growing all over the Nilghiris, at elevations varying from 4,000 to 8,000 feet. This indicates the temperature best suited to the perfect development of the fibre.

Produce per acre.—From the crop of July an average produce of from 450 to 500 lb of clean fibre per acre may be expected. Of this quantity about 120 lb will be a very superior quality, this is obtained from the young and tender shoots, which should be placed by themselves during the operation of cutting. The crop of January will yield on an average 600 or 700 lb per acre, but the fibre of this crop is all of a uniform and somewhat coarse quality, owing to shoots being matured by the setting in of the dry season in December. It might therefore, be advantageous where fine quality of fibre only is required, to cut the shoots more frequently, probably three or four times in the year, as only the finest quality of fibres is produced from young and tender shoots.

PREPARATION OF THE FIBRE.—Our experiments being limited, our treatment of the fibre has been necessarily very rude and imperfect, as in this respect efficient appliances can be obtained only in extensive cultivation.

PREPARA
TION
216

"The inner bark of the whole plant abounds in fibre, that of the young shoots being the finest and strongest, while that of the old stems is comparatively short and coarse, though even they produce a fibre of very great strength and of a peculiar silky and woolly like appearance, and one which no doubt will prove very useful in manufactures.

"For cutting down the crop fine weather is selected, and the shoots when cut are allowed to remain as they fall for two or three days, by which time they are sufficiently dry to have lost their stinging properties, they are, however, pliable enough to allow of the bark being easily peeled off the stems and separated from the leaves. The bark thus taken from the fine, if wet is dried in an open shed with a free circulation of air. When quite dry, the bark is slightly beaten with a wooden mallet, which causes the outer bark of that in which there is no fibre to break and fall off. The fibrous part of the bark is then wrapped up in small bundles, and boiled for about an hour in water to which a small quantity of wood ashes has been added in order to facilitate the separation of the woody matter from the fibre. The fibre is then removed out of the boiling water and washed as rapidly as possible in a clear running stream, after which it is submitted to the usual bleaching process employed in the manufacture of fibre from flax or hemp.

Var zeylanica.—Little is known regarding the fibre of this variety, although it is used in the Konkan and other parts of Western India. (Drury's Useful Plants, 225.) It would appear, however, that it is very similar to that produced by the true Nilghiri nettle, described above.

There is no doubt that these fibres are perhaps the strongest, and in many ways most valuable, of any produced in India, a very serious practical difficulty exists, however, against their extensive use in the stinging nets with which all the varieties are abundantly provided. These cause

TION.**

great annoyance to the persons employed in extracting the fibre, and even after being manufactured into cloth, the irritant property may not be completely destroyed. Indeed, in many cases, it persists to such an extent as to cause great irritation to the person wearing or even touching the cloth.

**MEDICINE.
221**

Medicine.—The medicinal virtues of this plant were first brought to notice by Captain W. H. Lowther, in the Journal of the Agri-Horticultural Society of India above cited. He claimed for it strong anthelmintic properties, and considered it, when properly administered, a specific for tænia or tape-worm. The treatment is described as follows: "I prefer the administration of the remedy when the plant is forming its seed vessels (all vegetable products being then fullest of their medicinal virtues). An ounce or more of LEAVES, STALKS, and CAPSULES, taken indiscriminately, are ground in a mortar, and sufficient water is added to form a draught. The patient should fast for twelve hours previous to taking the medicine, and three such doses should be given, one every four days. To destroy any latent germs, give for precaution's sake additional doses for two fortnights following." Captain Lowther's estimate of the drug is very high, and his results with the fresh plant, which he urges must alone be used, since it loses its value on drying, appear to have been good. As yet, however, no medical evidence in favour of the alleged virtues of *Gisekia* have been adduced, and in the Home Department correspondence, on the advisability of bringing out a new edition of the Indian Pharmacopœia, none

Glass is a mixture of silicate of potassium or sodium, or of both, with one or more silicates insoluble in water, such as those of the alkaline earths, aluminium, manganese, iron, or lead. The mixture is effected by fusion, which takes place less readily the more silica it contains. Silica for the manufacture of glass is obtained from ground quartz or flint, or from silicious sand, treated with a mineral acid to free it from metallic impurities. The alkali is derived from pearl-ash or wood-ash, carbonate of soda, or from other available sources. The		HISTORY. 230
requirements of Europeans; and glass drinking vessels are not used by the native population, indeed, by Hindoos on religious grounds. A serious difficulty in the way of the introduction of		

GLASS.

Glass and Glass-ware.

HISTORY.

glass-making industry in this country is the lack of fuel Mr. Baden Powell remarks on this subject, "It would probably be cheaper to carry such glass-making materials as are to be found in the Panjáb to the hearths of Staffordshire and bring them back made up into glass than to attempt the manufacture on a large scale here." Evidence, however, exists of glass-making having formerly existed on a much larger scale than it does at present. At the time of the composition of the *Yajur-veda* glass was one of the articles from which the ornaments of females were made. The substance is also mentioned in the *Mahábhārata*. In the *Ain-i-Akbari* glass for windows is included in the list given by its author of building materials, and it is said to have cost R1 for $1\frac{1}{2}$ s' or $\frac{1}{4}$ dam for one pane. Abul Fazi in his descriptions of Behar and Agra also mentions glass-making, and writes of Allore, "Here are considerable manufactures of woollen carpets and glass." A glass *guláb* bowl and a *hukka* bowl found in the Muhammadan capital, Bijapur, were shewn by Major Cole, R.E., at one of the Simla Art Exhibitions. These he described as probably of the sixteenth century. They were of thick white glass, cut or moulded in a hexagonal diaper pattern with fluted necks, and of undoubtedly Indian design, though of far superior workmanship to anything produced in this country of late years. Now-a-days, indeed, the glass-making industry is almost entirely confined to a few families in the Lahore, Karnál, Jhelam, and Hoshiarpur districts of the Panjáb; in the Bijnor and Saharanpur districts, N.-W. P.; in Lucknow; in Ahmadnagar, Kaira, and Baroda in Bombay; in Seoni, Central Provinces; in Patna, Bengal; in Jeypore; and in the North Arcot District of Madras. In these localities the glass-makers for the most part, confine their manufactures to rude globes, silvered inside with mercury and tinfoil, small coarse glass toys, rude bottles for attar, and to a greater extent beads and bangles. In Karnál the large, thin, pear-shaped glass retorts or carboys in which the native manufacture of Salammoniack is effected are also prepared.

In some parts of the country, however, the industry appears to have reached a higher development, as will be seen from the following short descriptions taken from the *Journal of Indian Art*: "Very curious coloured glass-ware is made at Patna. The specimens shewn at the Calcutta Exhibition were of considerable excellence. These articles would have an extensive sale if better known, and if proper facilities were afforded to the public for obtaining them." "In Delhi and Lahore glass bangles and lamp chimnies are made; in Karnál, glass globes, pear-shaped glass carboys; and various wares in Hoshiarpur. The art is as yet quite in its infancy. The Hoshiarpur workman is almost the only one of these who works independently with his own materials—independently, that is, of foreign aid—for the few glass-blowers in Lahore collect fragments of white European glass, and melting them down, blow cheap lamp chimnies and bottles. At Karnál the glass globes are made which when silvered inside are broken up into the small mirrors used in *shishadár* ornamental plaster, and run into embroideries known as *shishadár phulkaris*."

But the following passage is even of greater interest, since perhaps it describes the only branch of the industry worthy of the name of art-manufacture: "Kapadnanj, in the Kaira district, is the only place in the Bombay Presidency where glass is manufactured in its primitive state from a natural earth called *us*, which is a mixture of the Carbonates and Silicates of Soda with several mineral impurities. It is, however, remarkable for its iridescent properties and good colour, resembling the antique Venetian. The shapes are quaint and beautiful. It is said that crude glass of the value of about 3 lakhs of rupees is annually sent to Bombay for foreign export by some Bhoras and Banias, and that it is

purified and turned into various shapes in the glass manufactories of Europe. It would be interesting to find out some more definite statistical account of this trade, which, though at present represented by a few pots and bottles, may, if well regulated, develop into an important item of the manufactures of Bombay." With reference to the remark regarding the export of the glass to the East, it is stated that the

HISTORY.

colours are made at Jeypore and in many other places in the State. They are worn by Mussulmans."

Bangles.
236

About ten years ago endeavours were made by the Department of Industries, Matting, and the Engineering Department, as specially deputed to conduct experiments, beads for patterns, tools, and an account of the methods employed in Venice were obtained, and furnaces constructed on the English pattern were tried.

It was found as the result of these experiments—

- (1) That the *reh* was not sufficiently pure to make good colourless window glass
- (2) That the *reh*, when heated in a good furnace, yielded a material

(3) T

greater expense. The last result is particularly disappointing, since, as already remarked, beads and bangles are the only form of glass for which a really large demand exists amongst the native population of India.

Trade.—A large and increasing import trade exists in glass. In the year 1888-89, 6,407,266 superficial feet of sheet and plate glass was imported, value Rs. 61,550; 27,993 cwt of beads and false pearls, value Rs. 1,666,000.

TRADE
237

is small, amounting in value to from Rs. 29,910 in 1884-85 to Rs. 11,810 in 1888-89. Of this Rs. 6,956 worth was exported by Bombay, and Rs. 11,262 imported by Aden, which appears to be the chief market.

App. A., xli.; Gazetteer, Burma, I., 136.

Habitat.—A small evergreen tree found along the coast of Tenasserim.

DYE.
Wood.
253Dye.—Kurz mentions that the wood is used in Burma for dyeing, yield-
ing, with different mordants, various shades of colour from orange to black.
In the Burma Gazetteer the colours obtained are described as follows:
"With—1, muriate of tin,—three shades of orange varying with the tem-
perature of the bath and the time of immersion; 2, acetate of alumina,—
two shades of flame colour; 3, acetate of iron,—two shades of drab;
4, acetate of iron, with a weak solution of galls,—a fine black of two
shades."

TIMBER.

254

Structure of the Wood.—"Good for furniture, and when steeped in
ferruginous mud turns jet black, looking like ebony. Used also for build-
ing purposes, boxes, &c." (Kurz).

GLYCINE
hispidia.

The Soy Bean.

G. hispidia, Maxim., quite as much as it does the Indian cultivated "*G. Soja*," which, indeed, it connects with *G. hispidia*. It is, in fact, the plant most like the wild *G. Soja*, *S. et Z.*, which no one ever professes to have found wild in India, while it is also the one most like *G. hispidia*, Maxim. (which has never been found wild anywhere). It is the plant collected by Dr. Watt and myself in the Naga hills."

The writer noted on his Naga hill specimens that they were found in a semi-wild state, and that the plant was known to the Angami Nagas as *Tsu Dza*, a name not unlike *Soja*. Throughout India, the Soy Bean is cultivated, black and white-seeded forms being met with, which vary to some extent, but all preserve the specific characters of *G. hispidia*. Plants raised at Saharanpur from Japanese seed have larger and broader leaves than the usual Indian forms. The fact that this cultivated plant possesses, even among the aboriginal tribes, names which are original, i.e., in no way modern derivatives, points to an ancient cultivation, if, indeed, it may not be accepted as an indication of its indigenous nature. Habitat.—Extensively cultivated throughout India and in Eastern Bengal, Khásia hills, Manipur, the Naga hills, and Burma, often found as a weed on fields or near cultivation.

OIL.
Seed.

264

Oil.—Large quantities of the SEED are annually used by the Chinese in the manufacture of an edible oil. "It is said that they obtain 17 per cent. of oil, by simple pressure. It bears a general resemblance to the ordinary edible oils of commerce, possessing an agreeable flavour and odour. It is useful for burning; exposed to a low temperature it becomes pasty, and oxidizes rapidly on exposure to the air. As a drying oil it might replace linseed for some purposes. As an illuminator it is being rapidly replaced by American petroleum, but is still extensively used for food. It is an important article of Chinese commerce" (*Spons' Encyclopædia*, 1378).

MEDICINE.

Root.

265

FOOD and
FODDER.

266

Medicine.—A decoction of the ROOT is said to possess astringent properties.

Food and Fodder.—The Soy-bean forms an important article of food in China and Japan. Since 1873, it has been successfully grown in the warmer parts of Europe. It is also widely spread, in a cultivated state, over a great part of the Himálaya and the plains and lower hills of India. On the plains the crop is generally grown by itself, as a *khariif* crop; the seeds are sown from June to September, and the harvesting takes place from November to January. Church gives the following information regarding the best methods of cultivation: "The seeds should be placed at a depth not

I., 429.

Habitat.—A common evergreen shrub throughout the Tropical and Sub-tropical Himálaya, ascending to 7,000 feet in Sikkim. It extends from the Sutlej river in the North-West, eastwards and southwards to Upper Assam, Burma, Travancore, Malacca, and Ceylon.

Medicine.—*Mr. T. N. Mukharji* states that the roots pounded and mixed with sugar are given in cases of low fever by Native practitioners. *Lisboa* mentions that the wood bruised with water is administered internally as an antidote for snake-bite.

Food.—The fruit, a white berry, about the size of a large pea, is commonly eaten.

Structure of the Wood.—White, hard, close-grained.

Domestic Uses.—TWIGS used by the Bengalis to clean the teeth. The LEAFY TWIGS are in some of the rural parts of Bengal stuck into the walls and roofs of huts about the beginning of April to ward off lightning (see also *Euphorbia antiquorum*, p. 295).

Liquorice Root.

(F. Murray.)

GLYCYRRHIZA
glabra.

Habitat.—A perennial herb, of South Europe, Asia Minor, Armenia, Siberia, Persia, Turkistan, and Afghanistan. It is cultivated in Italy, France, Russia, Germany, Spain, and China, also to a small extent in England. Though neither wild nor cultivated in India it is an import of some consequence, and has been employed for medicine and in dyeing for many years. The root used in medicine is principally derived from two varieties, namely — *a typica*, and *γ glandulifera* (Boissier).

Dye—The wood, imported through the Panjáb from Afghanistan, is, in the North-West Provinces, employed in calico-printing, to perfume the fabric and give it a finish (Sir E. C. Buck).

Medicine.—Liquorice root has been used in Hindú medicine from a very remote period. U. Dutta states that "it is mentioned by Susruta,

DYE

is also dropped into the eyes to strengthen the sight. A poultice made of the LEAVES is said to be a cure for scald-head and stinking of the feet or arm-pits. Muhammad bin Ahmad, and Yohanna bin Serapion recommend the SEEDS as being the most active part of the plant, but remark that they are only produced in certain climates (eg, Basra)." In Europe also the medicinal value of Liquorice has long been known. It is unquestionably alluded to by Theophrastus, and by Dioscorides, who calls the plant *γλυκιστήνη*; also by several Roman writers (Ocserus, Scribonius, Largus, and others), who describe it under the name of

are employed as dyes by the Santals. This fact is of interest, as the
writer can find no reference to their being similarly utilised in other parts
of India

Medicine.—The root has long been an article of medicine with the
Hindus. It is described as bitter, tonic, stomachic, laxative, and useful in
fever, indigestion, anasarca, and various other complaints. U C Dutt
writes "It is an ingredient of *dasamula*" (a compound decoction of ten
plants,—*Desmodium gangeticum*, *Tribulus terrestris*, and others) "and is

292
Leaves
293

employed medicinally, and, in Northern India, the former is believed to
have anthelmintic properties

Food and Fodder.—This species flowers in the beginning of the hot
season, and produces a fruit in April and May which is eaten by the
Gonds and other hill tribes. The leaves are used as fodder, and are also
much browsed by deer and other wild animals.

Structure of the Wood.—Yellowish greyish or reddish-white, with a
glossy lustre, close and even-grained, soft, strong does not warp or
crack in seasoning, weight from 28 to 35lb per cubic foot, breaking
weight of a bar, 6 feet \times 2 inch \times 2 inch, 580lb (according to Baker)
It is light, has a good surface, is very durable, is easily worked, and
takes paint and varnish readily, and is, therefore, highly esteemed for
planking furniture, carriages, boat-decks, panelling and ornamental work

Habitat.—A large much-branching shrub of the forests of South India, Burma, and Ceylon; cultivated in Bengal.

MEDICINE.
Root
299

Medicine.—The root has been used as a demulcent by Hindú physicians from remote times. *Rumphius* mentions it under the name of "*jambusa sylvestris parviflora*;" *Louriero* speaks of its virtues in his *Flora of Cochin China*, commending it as of value in rheumatism and affections of the nerves; *Dr. Horsfield* in his *Account of the Medicinal Plants of Java* states that the plant was formerly in high esteem amongst the Portuguese, who called it *Rais Madre de Deos*. *Ainslie* also notices the plant, writing: "The root which, as it appears in the bazárs, is mucilaginous and demulcent, the Vytians reckon amongst those medicines which purify the blood, in cases of depraved habit of body; given in the form of electuary, to the quantity of a tea-spoonful twice daily." In another passage he describes the virtues of the LEAVES as follows: "Its leaves would appear to have the quality of thickening water, and rendering it mucilaginous when agitated in it, so becoming a useful drink in gonorrhœa, and other maladies requiring demulcents. Certain other leaves have the same property, with this difference, that when our article is gently stirred in water, and the leaves at the same time a little bruised, the thickening of the water, by this means produced, does not pass away, as in the other instances, but remains; so it must be considered as a much more valuable medicine." *Roxburgh* and *O'Shaughnessy* comment on the same property of the leaves, and their observations are republished in the *Pharmacopœia of India*, which includes the drug in its non-official list. At the present time the root is principally employed as a demulcent for gonorrhœa and catarrh of the bladder, in doses of ʒii to ʒiii in infusion, but it is also supposed to possess specific properties in the treatment of rheumatism and syphilis.

SPECIAL OPINIONS.—§ "Laxative and alterative. Useful in chronic rheumatism." (*Surgeon-Major F. McD. Houston, Travancore, and John Gomes, Esq., Medical Store-keeper, Trivandrum.*) "Useful in chronic rheumatism." (*Surgeon-Major F. J. L. Ratton, M.D., Medical College, Madras.*)

to a great extent of this rock. Another gneissic ridge is the Dhauladhar range, extending north of the Kangra Valley in a north-west direction as far as Dalhousie.

In Burma the gneissic series consists to some extent of granitoid and hornblendic gneiss. Little attention has hitherto been paid to the metamorphic rocks of Burma; they occupy a large but unexplored area in Upper Burma; they form all the higher ranges in the neighbourhood of Ava and extend throughout a great portion of the country, extending thence to Salwin. Further north, they reach from Bhamo to the neighbourhood of Momein in Yunnan; the crystalline rocks then continue to the south, forming the Red Karen country and the hills between Sittang and Salwin, and extend into Tenasserim.

In the Nilghiri hills there are several places where excellent building stones could be obtained, but hitherto not much use has been made of them. In Mysore a variety is obtained which can be split into posts 20 feet long, which are used as supports for the telegraph wires. In the construction of walls, "bunds" of tanks, the beach groynes at Tranquebar culverts, temples, bridges, &c., blocks of gneiss have been used. In Madras, beds of hornblendic gneiss are largely quarried at Palaveram, Cudapary Choultry, and Pattandalum for the manufacture of articles of domestic use as well as for building purposes. In the Nellore-Kristna district it is used in the manufacture of cart-wheels.

Except for purely local purposes, the construction of bridges, &c. where the rock nearest at hand has, upon economical grounds, been made use of, this material has not commended itself for building purposes to English engineers. It is, however, peculiarly susceptible to fine carving and, with the exception of some of the trap rocks, was the favourite stone for almost all the great temples in Southern India.

abundant evidence exists of the knowledge of gold in India from very remote times. Pliny in A.D. 77 referred to the country of the Nareae as containing numerous mines of gold and silver, and that by the Nareae were meant the Nairs of Malabar is now an established fact. Ancient inscriptions shew that in the eleventh century gold existed at least in Southern India in great abundance, and numerous and extensive, very

the same date, it is stated that "although gold is imported into Hindustan it is to be found in abundance in the northern mountains of the country, as also in Tibet. Gold may be obtained by the *Saloni* process" (washing) "from the sands of the Ganges, Indus, and several other rivers, as most of the waters of this country are mixed with gold

amount of success, and may develop into an industry of some importance. It may, accordingly, be of interest to give a short resumé of the facts regarding the occurrence and supply of gold in India at the present day.

Occurrence.—The following account of the localities in which gold is chiefly to be found in India is abridged, for the most part, from the exhaustive article on the subject in Ball's *Economic Geology*, to which the reader is referred for more detailed information.

The ultimate derivation of most of the gold of Peninsular India is doubtless from the quartz reefs which occur traversing the metamorphic and sub-metamorphic series of rocks, but a certain quantity appears to exist in certain chlorotic schists and quartzites, and possibly also in some forms of gneiss. Existing evidence regarding the relative productiveness of the reefs in the different groups or series of metamorphosed rocks is conflicting, probably owing to the fact that a rule which holds good in one part of the country does not necessarily apply to other areas. The presence of gold has not yet been proved in any member of the Vindhyan formation, but in the next succeeding formation several of the groups included in the Gondwana system are believed to contain detrital gold. It is almost certain, also, that the gold obtained in the Godavari and in its tributary near Godalore, or Mungapet, is derived from rocks of Kamthi age, and the gold of the Ouli river in Talchir (Orissa) is derived from sandstones. The only other sources in Peninsular India are the recent and sub-recent alluvial deposits which rest on the metamorphic and sub-metamorphic rocks.

Passing to the extra-peninsular regions, gold is met with in rocks of several different periods. In Ladak it occurs in quartz reefs which traverse carboniferous rocks, in Kandahar it is found in cretaceous formations, as an original deposit connected with the intrusion of trap; while all along the foot of the Himalaya, the tertiary rocks which flank the bases of the hills are more or less auriferous. But the gold occurring in the last-mentioned area is all detrital, and is doubtless derived from the crystalline metamorphic rocks of the higher ranges which are, from other reasons, known to contain gold.

I. MADRAS was in remote times famous for its gold mines, and has in recent years attracted much public attention and a large amount of capital in the endeavours that have been made to again open up a long dormant industry. Gold is known to exist in Travancore, Madura, Salem, Malabar, Wynaad, Mysore, and Bellary; but according to Ball its occurrence in Vizagapatam is as yet unproved.

Gold.	(J Murray)	GOLD.
In Travancore, it is found in outcrops of beds of quartzite including felspar, which run with the gneiss, but no real quartz reefs occur. Dr. W. King in a report to the Travancore Government (1881) stated that in only one c of stone.		MADRAS. Travancore. 320 Madura. 321

		Malabar. 323
	Dr Buchanan's instance of gold- ad the exclusive ge. Ainslie in- river at Calicut ated before the batore and the	
country west and south of the Nilghiri and Kunda hills, 2,000 square miles of soil were auriferous, and that at that time the Government derived a revenue from assessing the <i>puttis</i> or trays used to wash the gold. In 1831 the Collector of Malabar furnished a report to Government on the localities in which gold was then to be found, and in the same year Lieutenant Nicholson was appointed to prospect the gold-fields, and		
for a quarter of a century, at the end of which time, in 1857-58, letters from the Collector of Malabar again attracted attention to the subject. In 1865 two Englishmen with experience of Australian gold-mining were attracted to the district, and soon afterwards machinery was erected to		
rage of 1 ounce 8 dwt. 22 grains per ton. Mr. Brough Smith deals fully with such important subjects as climate, water, and timber-supply,		G. 323

GOLD.

Gold.

MADRAS.

&c., and, in his concluding remark, speaks with confidence as to the future of the industry, maintaining that failure can only result from want of care and forethought.

Professor Ball concludes his interesting account of the gold in this region, by giving an estimate of the cost of working a company on the authority of Mr. Ryan. As this is stated to be based on actual experience, it may prove both useful and interesting, and may be here quoted: "It being assumed that a concession of value cannot now be obtained at a less cost than £60,000, the following would represent the first year's expenditure:—

Price paid for concession	£	60,000
Cost of machinery, 100 stamp-heads at £200 each	£	20,000
One year's working expenses	£	12,000
Contingencies, law-expenses, &c.	£	8,000

Taking the value of gold at £3-15 per ounce, the return from 25,000 tons of stone, containing from 3 to 10 dwt. of gold per ton would be as follows:—

	Total ounces.	Value at £3-15.	Cost of production.*	Profit.	Percentage on capital of £100,000.
3 dwt. per ton . . .	3,750	£14,062	£11,875	£2,187	£2'19
4 " " " . . .	5,000	18,750	11,875	6,875	6'87

10 " " " . . .	12,500	46,875	11,875	35,000	35'00

MYSORE.
324

II. MYSORE PROVINCE.—Captain Warren, in 1802, hearing of a rumour that gold had been found at the Yerra Baterine Hill, instituted enquiries which elicited the fact that there were gold-washings near the village of Wurigam (the modern Urigam or Ooregaum), and actual mining at Marcurpam. He proved the presence of gold in the surface soil and beds of the rivers over an extended area in the neighbourhood of the Manigatta, Wullur, and Yeldur hills, from Budikote to Ramasamudra. The people who washed were Dherus or Pariahs, and he appears to have thought that agriculture was for them a more profitable profession. He then described two mines, one at Kembly, 30 feet deep, having a gallery of 50 feet; the other west of Surunpally, which was 45 feet deep and 56 feet in extent. From the sections given, Ball remarks "it is evident that these were not in solid rock, but that masses of quartz in an ochreous matrix had been taken out to be crushed." Later, Heyne alludes to Warren's researches, and various officers appear to have collected samples from the same region at subsequent dates. General Sir Mark Cubbon, when Commissioner of Mysore, is said to have prohibited more mines being sunk, in consequence of the frequency of accidents in those already existing. Subsequent to this date little attention appears to have been paid to the subject for nearly fifty years.

Of late years, however, the gold industry in this province has received a marked impetus, and its gradual growth can be traced through succe-

* This sum is arrived at as the average of several estimates of cost, 25,000 tons at 9s. 6d. = £11,875.

Gold	(J Murray)	GOLD
		MYSORE

quantities in certain districts, and permission was granted to a Mr Lavelle to prospect for gold and other metals during a period of three years. He was informed that leases for a period of twenty years would be granted to him, of not more than ten blocks, each of two square miles

Kolar gold-field has a future before it. But that the expectations that were first started when gold-mining in India was revived in 1880 will ever be realised in this (or any other gold field in any part of the globe) is very doubtful. Some of the mines are now paying expenses, and there can be no doubt that, managed economically and under scientific supervision, several others should easily pay their way at an early date. If regular divi-

has been a
ting
new
take
do n

buted to the *Records of the Geological Survey of India*, has also taken a more favourable view of the subject. In one passage he writes, "the great success attained at a good number of the mines now being worked there has proved beyond all cavil, that gold does exist in richly paying quantity in many of the lodes running through the Dharwar schists" (the Kolar Gold-

GOLD.

Gold.

MYSORE.

Field Band), "and I for one firmly believe that lodes of equal richness will be found in other tracts in which similar geological conditions prevail." In another passage he writes, "the results already obtained at Kolar are abundantly good enough to encourage sensible people to proceed with care and forethought to open other mines." In his opinion the gold-mining operations at present conducted, have only to a very small extent tapped the gold-bearing rocks of Mysore. Over the whole extent of the province from north to south, run well-marked bands of Dharwar schists, which all bear evidence of having been worked to a greater or lesser extent by Natives in remote times. The Kolar band does not belong to these well-marked great bands of Dharwar, but is an outlier of limited extent. Of the great bands traversing Mysore, the western is said by Mr. Foote to be the largest and least known, being covered by the dense forests and steep hills of the Western Ghâts.

HYDERABAD.
325

III. HYDERABAD.—Gold-dust is found in the bed of the Godavari and its tributaries, and appears to have been fairly extensively worked up to the end of last century; at that time, however, operations ceased owing to an excessive rent charged by the Raja. According to Dr. Walker there was a gold mine about 1790 near the village of Goodloor or Godalore, in the vicinity of Mungapet, but Ball points out that, owing to the absence of crystalline rocks in the neighbourhood, it is improbable that there ever was a real mine there.

BENGAL.
326

IV. BENGAL.—Gold is obtained in Orissa, Midnapur, Bankura, and in the Province of Chutia Nagpur, the last-mentioned locality being apparently specially rich in the metal.

Orissa.
327

Orissa.—Ball states that "within the limits of the Province of Orissa gold-washing is or has been carried out in the Native States of Dhenkanal, Keonjhar, Pal Lahara, and Talchir. It is a poor pursuit, as in so many other parts of the country, but the fact is interesting as affording evidence of the existence of gold." At the present time gold-washing is carried on most actively in the Brahmini river, where it traverses Pal Lahara.

Midnapur.
328

Midnapur district contains a few professional gold-washers, who apparently carry on their industry in the beds of the Kasai river and its tributaries.

Bankura.
329
Chutia
Nagpur.
330

Bankura district.—Gold is reported to have been obtained in very small quantities in the sands of the Dalkissur at Bankura.

Chutia Nagpur.—Ball writes, "From the characters of the rocks found in the sub-divisions of this province, it is not improbable that gold occurs in all of them, whether because it is less abundant in some, as is probable, or because it has never been properly searched for, the fact is certain that in others there is greater attraction for the indigenous gold-seeker. Judged by this standard, the richest tracts are situated in Manbhum, Singhbhum, Gangpur, Jhashpur, and Udaipur. That these, or some of them, may yet be the scene of extensive operations, should the gold-mining in Southern India be successful, is very possible. The indications afforded by the alluvial deposits of sources of gold existing in the rocks over several large areas, are perhaps quite as striking in their way as those which led to the starting of the gold-mining industry in Southern India. Quartz or reef mining and crushing, however, can scarcely be said to have been tried in this area, but one solitary and not very expensive attempt having been made." It is stated that three companies have lately (1890) started for gold working in this province, and that a probability exists of two or three other companies being formed for the same purpose.

Manbhum.
331

In Manbhum the localities where gold-bearing sands exist are very numerous; indeed, in the southern half of the district, gold is to be found in nearly every stream. Ball discovered, by a systematic application of

Gold.	(J Murray)	GOLD.
		BENGAL Chutia, Nagpur.

	..	Singbhum 332

state (*Medico Topography of Ceded Provinces, 1826*)
Many records

river Ebe or Ib there are tracts at some distance from the banks, which
are honey combed with shafts sunk by successive generations of gold-

mint for assay, and a nugget from some other part of Jashpur was pre-
sented to the Geological Survey Museum by Colonel Dalton The latter

GOLD.	Gold.
BENGAL.	are the Mand and Ebe, with their numerous tributaries. As there is always water in the Ebe, it is possible that some system of hydraulic mining might be applicable. Be that as it may, there cannot but be gold-bearing reefs from which all this gold has been derived."
Udaipur. 333	In <i>Udaipur State</i> , also, the rivers contain auriferous sands. The first to call attention to the washings in this state was Colonel Ousely in 1847, at which time he reported that three families at Rabbob obtained a livelihood by the industry. In 1849 a Mr. Robinson took a lease of the village, with permission to work the mines, from Government, and found as the result of his trials that a man to whom he paid 1 anna could earn for him 3 to 4 annas worth of gold. The gold obtained was valued at the Calcutta Mint as worth $\text{Rs } 1\frac{1}{4}$ per tola. The unhealthiness of the district for Europeans appears, however, to have resulted in the cessation of the enterprise. In 1865 the number of native gold-washers was stated to have increased to six families, and the reporter (the late Colonel Dalton) wrote that the production of gold was only restricted by the number of washers.
CENTRAL PROVINCES. 334	V. CENTRAL PROVINCES.—Gold-bearing sands occur in most parts of these provinces, wherever there are exposures of the older crystalline rocks. Judging by the census returns of 1872 Nagpur division is the richest, followed by Jabalpur and Chatisgarh, while in the Nerbada division none of the inhabitants were returned as gold-washers.
Chatisgarh 335	<i>Chatisgarh Division</i> .—In the district of Sambalpur gold-washing is pursued as an industry at Sambalpur town on the Mahanadi, and at the village of Tahud on the Ebe. In the Bilaspur district gold is known to occur in the Jonk river at Sonakhan. In the Raipur district 12 gold-washers were returned in the 1872 census, though it is not known in what localities they pursue their avocation. It has been asserted, however, that gold is procurable in the Mahanadi at Rajoo (probably Rajim is meant by this name).
Nagpur. 336	<i>Nagpur Division</i> .—In the Bhandára district gold-bearing sands occur in streams near Ambagarh and Thirora. In these waters gold-washing operations are carried on, and in some places mercury is employed in separating the finer particles. In the Chándá district the search for gold is said to be carried on in the eastern parts of the area, but there are no definite details as to the actual streams in which the metal is found. Gold is washed in several places in the Bálághát district, the auriferous streams being chiefly situated in the Lanji and Dhansua Parganas. Of these the Son and Deo are richest in the metal. The census returns of 1872 give 103 gold-washers in the Nagpur district, but it is probable that these men carry on their operations chiefly in the adjoining districts.
Jabalpur. 337	<i>Jabalpur Division</i> .—In the district of Wardhá, Sagar, and Dámoh returns are made of some 52 gold-washers, though there is no record of the occurrence of gold in these localities. The sands of the Parqudhar stream, in the Seoni district, however, produce gold. Balfour states that the washers of the sands of this river consider it unlucky to make more than 4 annas a day, as they believe that the goddess who makes the gold would leave the locality if they exceeded that amount.
Upper Godavari. 438	In the <i>Upper Godavari District</i> gold is said to be found in two localities, namely, near Bhadrachellum and at Marigudem or Mariguram. The gold of the latter locality is of superior quality, being valued at $\text{Rs } 16$ a tola, yet notwithstanding this fact, the work of washing is said in the <i>Central Provinces Gazetteer</i> to be "barely remunerative." It must consequently be inferred that the metal occurs in small quantity only. Gold-washing is also carried on in the Bastár State at Pratappur or Partabpur, and at Bharamgarh.
CENTRAL INDIA. 339	VI. CENTRAL INDIA— <i>Ajmir-Merwara District</i> .—According to Dr.

and in the province of Kathiawar.

Dharwar District.—Gold has been found at Chik Málgúnd, Súrúr, Dambal, Dhoni, and in the Hurt river near Gudak. Mr Foote, in the *Records of the Geological Survey of India*, has given a *résumé* of the writings of other authors on the subject of gold in this district, together with his own observations. He considers that the rocks of the known gold-bearing area belong to three groups or series, each characterised by cer-

locality, and apparently sank two shafts—one in the Dhoni, and one in the Kappatgode series.

Belgaum District.—Gold-dust is said to have been found within the limits of this district at or near the villages of Belowuddi, Bjl Hongul, and Murgur. The quantity must, however, be small, since very few gold-washers pursue their calling in the district.

Kalaadgi District.—Mr. Foote mentions a report of auriferous sands in the district, but adds that he has reason to

axis of the Himalayas, or merely having their sources in the mountains. The formations do, as a general rule, must have a doubly derived deposits of it, can be expected to occur.

The practice of gold-washing in this province is probably of considerable antiquity, formerly it afforded a source of revenue, indeed during the Sikh predominance, the tax amounted to one-fourth the gross produce. This

GOLD.	Gold.
PANJAB.	revenue has, however, here, as in most other parts of India, dwindled down to very small proportions, or become totally extinct. In 1860-61 it was R444 and in 1861-62 R530. Abul Fazl mentions that in the time of Akbar gold was obtained by washing in rivers in the <i>subāh</i> of Lahore. Ball states that the districts it is at present found are, Bannu, Peshawar, Hazara, Rawal Pindi, Jhīlam, Amballa, and certain Native States, and gives the following detailed information regarding each.
Bannu. 346	<i>Bannu District.</i> —Gold-dust is obtained from the Indus at and below Kalabagh to the annual value of about R200. It is doubtful whether the source of the metal is the low tertiary rocks or the older rocks higher up the valley.
Peshawar. 347	<i>Peshawar District.</i> —About 150 men wash for gold in the Indus above Attock and in the Kabul river, during part of the year, their regular avocation being that of boatmen. Each man is said to obtain on an average about 2 to 2½ tolas of gold, which sells for about R15 a tola. Ball calculates, from the time spent in collecting, that this amount only yields a daily wage of about 2 annas.
Hazara. 348	<i>Hazara District.</i> —Here as elsewhere the Indus yields a small quantity of gold-dust, which is similar in quality and value to that obtained in the Peshawar district.
Rawal Pindi. 349	<i>Rawal Pindi District.</i> —The sands of the Indus between Attock and Kalabagh are washed for the metal. Dr. Jameson, in 1843, stated that about 300 individuals used then to engage annually in the search for gold in this region, employing large wooden troughs and mercury, that one-fourth of the proceeds was claimed by the Sikh Government, and that the actual earnings of the men were estimated to be from 3 to 4 annas a day. Within the last few years, it is believed, endeavours have been made to establish washings on the Ravi, and in other parts of the Rawal Pindi district on a large scale. The experiment was not, however, financially successful.
Jhīlam. 350	<i>Jhīlam District</i> contains most of the gold-washings of the Salt-Range. These are situated in the beds of rivers and streams arising from the lower Siwalik group, the detrital beds of which yield the metal. Ball states that "much of the gold is invisible or nearly so, and would be lost but for the employment of mercury." Under the Sikh Government about 160 cradles were worked, and afforded a revenue of over R500. Baden Powell quoting Dr. Flemming gives the annual production from these washings in 1848 as 1,013 tolas or about £1,600. The Bunhar river is specially mentioned by Mr. Wynne as gold-producing, and Ball states that from it westwards up to the Indus many of the streams which rise on the northern flank of the range contain gold.
Kangra. 351	<i>Kangra District.</i> —Gold is found in the Bias near Haripur, and also in Spiti, Kulu, and Lahul, but nowhere in large quantity.
Amballa. 352	<i>Amballa District.</i> —Specimens of gold from the Markunda river were exhibited at the Lahore Exhibition, and records exist of gold-washing having been carried in the neighbouring stream, the Gumti, from which the Raja of Nahan at one time derived a small revenue. Balfour mentions, but on what authority he does not state, that gold has been found in large quantities between Amballa and Kalka.
Gurgaon. 353	<i>Gurgaon District.</i> —Gold is said to be found in the streams near Sonah.
KASHMIR. 354	IX. KASHMIR.—Abul Fazl states in the <i>Ain-i-Akbari</i> that gold was found in the time of Akbar, in Padmatti, Puckely, and Gulkut (? Gilgit) of the Subah of Kashmir, and describes a peculiar process employed in obtaining it. This consisted in pegging down the skins of animals in the beds of gold-bearing streams. The hair on the skins acted, like the blanket used by miners in modern days, by arresting small particles of gold, which were

Gold	(J Murray)	GOLD
shaken out after drying the skins. Though there is apparently little doubt but that gold was at one time obtained in Kashmir proper few authentic records exist regarding it. At the present time, in the territories of the Maharajah of Kashmir the industry appears to be almost confined to		KASHMIR

X TIBET — Though this country is not within the limits of India a short account of the gold obtained from it may be here given since there is every reason to believe that for many centuries it has been the source of a regular supply to this country. The survey parties of 1867-68 discovered the existence of large gold fields at Thok Jalung (in the province of Nari Khorsam) Thok Nammo and Thok Sariung which were regularly worked by large encampments of Tibetan miners. One of the Pandits accompanying the expedition gave an interesting account of the habits and methods of work of these miners one of the passages from which may be here quoted as throwing a light on the old story of gold digging ants.

The cold is intense and the miners in winter are thickly clad with furs. They do not merely remain underground when at work but the small

their tents which in summer amounts to 300 rises to nearly 600 in winter. They prefer the winter as the frozen soil then stands well and is not likely to trouble them much by falling in. Sir Henry Rawlinson and Professor Schiærn commenting on these observations arrive at the conclusion

that Schiærn argues that these may have been horns taken from the fur dress of the miners. Ball thinks they may have been more probably the horns of *Ovis vignei* which were probably in ancient times as they are

COLLECTION.

Singhbhum District of Chutia Nagpur has been selected by Ball as typical, and may be here quoted :—"Each tribe occupies a distinct tract, and poaching on one another's favourite streams is not indulged in to any great extent. The wooden dish used for washing, measures on an average about 28 by 18 inches for the men, smaller ones being used by the women and children amongst the Jhoras. The dish is hollowed somewhat eccentrically to a maximum depth of $2\frac{1}{2}$ inches. A scraper, formed of a flattened iron hook set in a handle, is used to collect the auriferous sand and gravel which accumulates in the angles formed by the rocks in the bed of the stream. The dish when filled is placed in shallow water, and the operator working with his hands soon separates and throws aside all the coarser gravel and stones, whilst the agitation of the water serves to carry away all the mud and lighter portions. The dish is then balanced on the palm of the left hand and oscillated to and fro with the right; this serves to throw off the greater portion of the remaining gravel, and the process is completed by a circular motion, which is communicated to the water in the hollow of the dish, by which even the smallest particles of foreign matter is separated, and the final result is a residue of black iron sand, in which the specks of gold are readily apparent; but as mercury is not employed in this part of the country, all the very small and invisible gold is lost." As already stated, this process is supplemented in some parts of the country (e.g., the Panjáb) by the employment of the amalgam method with mercury; in others skins, horns, &c., &c., are placed in the stream to mechanically arrest fine particles of gold, and in Assam moss and slime scraped from the beds of the streams are similarly used. An idea also prevails in Assam that gold can be obtained by burning the leaves of a plant known as the *copat*. A somewhat peculiar system exists in the washings of the Ningthi river on the Burma-Manipúr border. "The sand and gravel is first placed on a sieve, the finer parts being allowed to fall through on to a hollowed plank 4 feet long and $2\frac{1}{2}$ feet wide at the upper end, and $1\frac{1}{2}$ feet at the lower which is open, the top and margins being protected by a rim $\frac{1}{2}$ inch high. The lower half is cut into grooves half an inch deep and the same in width. The fine sand caught in these grooves is washed in a wooden dish resembling a shield in shape which has a polished black internal surface, and a receptacle in the centre. Placed floating in water it is revolved till all the sediment is removed and the mere sand and gold are alone left remaining."

MEDICINE
370

Medicine.—Gold was in remote times employed as a medicine in Europe, and is to this day largely used by followers of Sanskrit medicine. Pliny informs us that in his time it was considered a sovereign remedy for 'green wounds,' that it was supposed to destroy warts, and that Roman mothers hung it round the necks of their children to ward off the evil effects of sorcery. By Sanskrit physicians it was supposed to be a valuable tonic and alterative, to increase strength and beauty, to improve the intellect and memory, to clear the voice, and to increase the sexual powers. These imaginary properties are still largely believed in, and gold is now, as it was centuries ago, much administered in Hindú medicine. Pure leaf gold is employed, purified by heating and cooling it alternately with *Kanjika*, oil, cow's urine, butter-milk, and a decoction of horse-gram. It is then reduced to powder by being rubbed with mercury and exposed to heat in a covered crucible with the addition of sulphur, and is in this form administered in doses of 1 to 2 grains. It enters into many complicated medicinal compounds, each of which is supposed to have some specific virtue. An exhaustive and interesting account of these will be found in *U. C. Dutt's Hindu Materia Medica*, from which the above abstract of the Indian methods of employment as a medicine has been mainly compiled.
